VOLUME II ISSUE 11 • Devoted to the 68XX User • November 1980
"Small Computers Doing Big Things."

SERVING THE 68XX USER WORLDWIDE

SYSTEMS - SOLUTIONS

If you have a problem that can be solved by a computer—we have a systems solution.

- Two central processors with maximum RAM capacities of 56K and 384 K bytes
- Three types of disk drives with capacities of 175K, 1.2M and 16M bytes
- Two dot matrix printers with 80 and 132 line capacity
- A Selectric typewriter interface and a daisy wheel printer

Match these to your exact need, add one or more of our intelligent terminals and put together a system from one source with guaranteed compatibility in both software and hardware.

Southwest Technical Products systems give you unmatched power, speed and versatility. They are packaged in custom designed woodgrain finished cabinets. Factory service and support on the entire system and local service is available in many cities.

SOUTHWEST TECHNICAL PRODUCTS CORPORATION
219 W. RHAPSODY
SAN ANTONIO, TEXAS 78216 (512) 344-0241

UniFLEX™

Multi-User

UniFLEX is the first full capability multi-user operating system available for microprocessors. Designed for the 6809 and 68000, it offers its users a very friendly computing environment. After a user 'logs-in' with his user name and password, any of the system programs may be run at will. One user may run the text editor while another runs BASIC and still another runs the C compiler. Each user operates in his own system environment, unaware of other user activity. The total number of users is only restricted by the resources and efficiency of the hardware in use.

Multi-Tasking

UniFLEX is a true multi-tasking operating system. Not only may several users run different programs, but one user may run several programs at a time. For example, a compilation of one file could be initiated while simultaneously making changes to another file using the text editor. New tasks are generated in the system by the 'fork' operation. Tasks may be run in the background or 'locked' in main memory to assist critical response times. Inter-task communication is also supported through the 'pipe' mechanism.

Support

The design of UniFLEX, with its hierarchical file system and device independent I/O, allows the creation of a variety of complex support programs. There is currently a wide variety of software available and under development. Included in this list is a Text Processing System for word processing functions, BASIC interpreter and precompiler for general programming and educational use, native C and Pascal compilers for more advanced programming, sort/merge for business applications, and a variety of debug packages. The standard system includes a text editor, assembler, and about forty utility programs. UniFLEX for 6809 is sold with a single CPU license and one years maintenance for \$450.00. Additional yearly maintenance is available for \$100.00. OEM licenses are also available.

FLEX™

UniFLEX is offered for the advanced microprocessor systems. FLEX, the industry standard for 6800 and 6809 systems, is offered for smaller, single user systems. A full line of FLEX support software and OEM licenses are also available.

—ITEMS SUBMITTED FOR PUBLICATION—

(Letters to the Editor for Publication) All 'letters to the Editor' should be substantiated by facts. Opinions should be indicated as such. All letters must be signed. We are interested in receiving letters that will benefit or alert our readers. Praise as well as gripes is always good subject matter. Your name may be withheld upon request. If you have had a good experience with a 6800 vendor please put it in a letter. If the experience was bad put that in a letter also. Remember, if you tell us who they are then it is only fair that your name 'not' be withheld. This means that all letters published, of a critical nature, cannot have a name withheld. We will attempt to publish 'verbatim' letters that are composed using 'good taste.' We reserve the right to define (for '68' Micro) what constitutes 'good taste.'

(Articles and items submitted for publication) Please, always include your full name, address, and telephone number. Date and number all sheets. TYPE them if you can, poorly handwritten copy is sometimes the difference between go, no-go. All items should be on 8X11 inch, white paper. Most all art work will be reproduced photographically, this includes all listings, diagrams and other non-text material. All typewritten copy should be done with a NEW RIBBON. All hand drawn art should be black on white paper. Please no hand written code items over 50 bytes. Neatly typed copy will be directly reproduced. Column width should be 3½ inches.

(Advertising) Any Classified: Maximum 20 words. All single letters and/or numbers will be considered one (1) word. No Commercial or Business Type Classified advertising. Classified ads will be published in our standard format. Classified ads \$7.50 one time run, paid in advance.

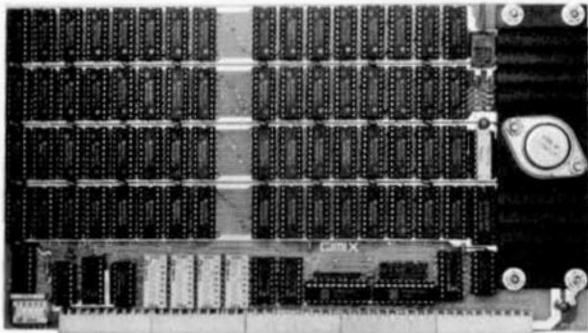

Commercial and/or Business advertisers please write or phone for current rate sheet and publication lag time.

LOOK WHAT'S COOKING on the FIFTY BUS 32K STATIC RAM BOARDS

Designed for use with:

★ Existing SS50 Systems ★ SS50C Extended Address Systems

FEATURES:

- Decoding for 4 Extended Address Lines (allows memory decoding up to 1 megabyte)
- DIP-switch to set extended addressing or disable it
- 4 separate 8K blocks, addressable to any 8K boundary by DIP-switch
- Each 8K block may be individually disabled
- Write protect either of two 16K sections
- Low power consumption — uses 2114L low power RAMs
- Fully Socketed
- Gold Bus Connectors
- Guaranteed 2MHz operation

AND NOW... GIMIX OFFERS YOU A Choice of 6800 or 6809 CPU CARDS

You can order your system to fit your needs or select one of the below featured systems. Please contact the factory for further information and availability.

Add as much memory as you need using GIMIX Static RAM Cards for the utmost in reliability.

32K 6800 SYSTEM \$1,694.59

Includes: Chassis, 6800 CPU, 32K RAM BOARD, I/O card

32K 6809 SYSTEM \$1,844.69

Includes: Chassis, 6809 CPU, 32K RAM BOARD, I/O card

32K 6809 PLUS SYSTEM \$1,994.79

Includes: Chassis, 32K RAM BOARD, I/O Card, and features our 6809 PLUS CPU Card with the Time of Day Clock option with battery back-up installed, as well as the 6840 Timer Package that provides 3 independent 16 bit counters.

This system also allows the following options to be added at additional cost:

- Battery back-up of the 1K RAM by substituting CMOS parts.
- A 9511 or 9512 Arithmetic Processor.
- GIMIX or SWTP Dynamic Address Translators.

EXPORT NOTES:

For 50Hz 230V C.V. POWER SUPPLY Add \$30.00
80 x 24 VIDEO BOARDS — Specify Format [No Added Charge]

On Orders under \$250.00 for a Single Board, or Chips, please Add \$30.00 Handling and we will ship Air Mail Prepaid. On all other orders we will ship via Emery Air-Freight Collect, and we will charge no handling. All orders must be prepaid in U.S. Funds. Please note that foreign checks have been taking about eight weeks for collection, so we would advise wiring money or checks drawn on a bank account in the U.S. Our bank is the Continental Illinois National Bank of Chicago, Account #73-32033. Visa or Master Charge also accepted.

BOTH 6809 SYSTEMS FEATURE OUR NEW TERMINAL BASED GMXBUG 09 SYSTEM MONITOR

GMXBUG 09 includes advanced debugging tools, utility, and memory manipulation routines.

Both 6809 Systems:

- ★ Can be reconfigured to allow use of other system monitors (OS-9 and SBUG-E)
- ★ Include 1K of Scratchpad RAM on the CPU
- ★ Allow optional software switching of system monitors.

2MHz 6809's at slight additional cost when they become available.

Phone, write, or see your dealer for details and prices on our broad range of Boards and Systems for the SS50/SS50C bus and our AC Power Control Products for all computers.

OS-9™ LEVEL TWO MULTIUSER OPERATING SYSTEM

- T**rue multitasking, multiuser OS for timesharing or real-time control applications.
- Sophisticated memory management permits use of over one megabyte.
 - Versatile, easy-to-use input/output supports multiple devices.
 - UNIX™-like file structure including hierarchical directories, pipes, filters, and byte-addressable random access files.
 - Provides log-on password protection and user file security.
 - Can run on small, inexpensive systems with floppy disks and as little as 32K memory.
- \$495.00*

OS-9™ LEVEL ONE OPERATING SYSTEM

- S**ingle-user, single-memory map compatible subset of Level Two for software development or stand-alone control applications.
- Versatile input/output system can support multiple devices using interrupt-driven, DMA, or program-controlled data transfer. Users can easily add additional I/O devices.
 - Tape or disk-based versions available.
 - Disk versions support UNIX™-like hierarchical directory structure and byte-addressable random-access files.
 - Memory management for single address-space (up to 64K).
- Disk version \$150.00*
- Tape version \$95.00

BASIC™ PROGRAMMING LANGUAGE SYSTEM

- E**xtended BASIC language compiler/interpreter with integrated text editor and debug package. Runs standard BASIC programs or minimally-modified PASCAL programs.
- Permits multiple named program modules having local variables and identifiers. Modules are reentrant, position independent and ROMable.
 - Additional control statements for structured programming: IF ... THEN ... ELSE, FOR ... NEXT, REPEAT ... UNTIL, WHILE ... DO, LOOP ...

INTRODUCING

6809 SOFTWARE POWER TOOLS.

BY MICROWARE®

and edited.

- Buffer, line and character oriented commands.
 - Search, change and extend operations.
 - Permits multiple input/output files.
- Disk or tape \$75.00
- ROM set (2716) \$90.00

OS-9™ INTERACTIVE ASSEMBLER

Compact Motorola compatible assembler for machine language program development.

- Operates in "batch" mode or interactive line-by-line mode.
 - Facilities for generation of OS-9™ memory modules and system calls.
 - Formatted listings include syntax and context error checking.
- Runs on OS-9™ Level One or Level Two.
- Disk or tape \$75.00
- ROM set (2716) \$90.00

OS-9™ INTERACTIVE DEBUGGER

Facilitates testing and debugging of machine-language programs.

- Includes common "monitor" functions: memory examine/change, breakpoints, display/change registers, hexadecimal arithmetic, etc.
 - Access to system command interpreter.
 - Available on ROM, disk or cassette tape.
- Disk or tape \$35.00
- ROM (2716) \$50.00

BASIC™ is a trademark of Motorola. OS-9 is a trademark of Motorola and Microware®. UNIX is a trademark of Bell Telephone Laboratories.

Most software is available on ROM, diskette and tape in versions for many popular 6809 computers. Source listings and yearly maintenance/update service are sold separately for most programs.

*Specify manufacturer and type of CPU and I/O controllers. Contact Microware® for specific availability.

OS-9™ TEXT EDITOR

Minimum-keystroke macro text editor useful for text preparation or interactive word processing.

- User-defined macros with parameters permit virtually unlimited command expansion. Macros can be saved, loaded

MICROWARE®

A/BASIC COMPILER

This BASIC compiler generates pure, fast, efficient 6800 machine language from easy to write BASIC source programs. Uses ultra-fast integer math, extended string functions, boolean operators and real-time operations. Output is ROMable and runs without any run-time package. Disk versions have disk I/O statements and require 12K memory and host DOS. Cassette version runs in 8K and requires RT/68 operating system.

- Disk Extended Version 2.1
SSB or FLEX® Diskette \$150.00
- Cassette Version 1.0. \$65.00

A/BASIC SOURCE GENERATOR

An "add-on" option for A/BASIC Compiler disk versions that adds an extra third pass which generates a full assembly-language output listing and assembly language source file. Uses original BASIC names and inserts BASIC source lines as comments.

- SSB or FLEX® Diskette \$75.00

A/BASIC INTERPRETER

Here it is - a super-fast A/BASIC compiler! Now you can interactively edit, execute and debug A/BASIC programs with the ease of an interpreter - then compile to super efficient machine language. Also a superb stand-alone applications and control-oriented interpreter. Requires 8K RAM. The cassette

INNOVATION AND PERFORMANCE

6800 SOFTWARE SUPER POWER

BY MICROWARE

version is perfect for Motorola D2 kits.

- Cassette, SSB or FLEX® Diskette \$95.00

LISP INTERPRETER

The programming Language LISP offers exciting new possibilities for microcomputer applications. A highly interactive interpreter that uses list-type data structures which are simultaneously data and executable instructions. LISP features an unusual structured, recursive function-oriented syntax. Widely used for processing, artificial intelligence, education, simulation symbolic, and computer-aided design. 6800 LISP requires a minimum of 12K RAM.

- Cassette, SSB or FLEX® Diskette \$75.00

*FLEX is a trademark of Technical Systems Consultants

RT/68 REAL TIME OPERATING SYSTEM

MIKBUG — compatible ROM that combines an improved monitor/ debugger with a powerful multitasking real-time operating system. Supports up to 16 concurrent tasks at 8 priority levels plus real time clock and interrupt control.

Thousands in use since 1976 handling all types of applications. Available on 6830 (MIKBUG-type) or 2708 (EPROM-type) ROM. Manual is a classic on 6800 real-time applications and contains a full source program listing.

- RT68MX (6830) \$55.00
- RT68MXP (2708) \$55.00

6800 CHESS

A challenging chess program for the 6800. Two selectable difficulty levels. Displays formatted chess board on standard terminals. Requires 8K memory. Machine language with A/BASIC source listing.

- Cassette, SSB or FLEX® Diskette \$50.00

Our software is available for most 6800 systems on cassette or diskette unless otherwise noted. Phone orders welcomed. We accept MASTERCHARGE and VISA. We try to ship orders within 24 hours of receipt. Please call or write if you require additional information or our free catalog. Microware® software is available for OEM and custom applications.

MICROSOFT DISK EXTENDED BASIC FOR OS-9™

Microsoft Basic is by far the world's most popular Basic language — and a vast library of applications software written for it can be used on your system: business packages, scientific, engineering and educational programs, games, etc. The OS-9™ version of Microsoft Basic is a full implementation of Release 5.0 with the following features:

- Four variable types: Integer, String, Single Precision Floating Point (7 Digit), Double Precision Floating Point (16 Digit).
- Full PRINT USING for formatted output (includes asterisk fill, floating \$, scientific notation, trailing sign, comma insertion).
- Trace Facilities for program debugging.
- Extensive program editing facilities via EDIT command.
- Matrices with up to 255 dimensions.
- IF/THEN/ELSE and WHILE/WEND for structured programming.
- Automatic Line numbering and renumber.

- Dynamic string space allocation.
- Random and sequential file I/O with variable length records.
- Protected files can be saved in coded binary format.
- CHAIN and COMMON statements — programs may be linked together and share common variables.

This version of Microsoft Basic is not just a reassembled 6800 Basic — it has been enhanced to take full advantage of the 6809 and OS-9™ superior capabilities. It is also a reliable Basic that you can count on for your important programs.

- Microsoft Extended Basic Release 5.0 for OS-9™ \$250.00
- Also available: Standard Microsoft 6800 or 6809 Basic Release 4.51 for Flex*. Many features of OS-9™ version. \$250.00 *Trademark of Technical Systems Consultants

In the world of 6800 Microcomputing there is only one Universal Mini-Disk System . . .

the PERCOM LFD-400™ with SOFTRAN™

Made possible by SOFTRAN™, an innovative \$24.95 translator program, the reliable Percom LFD-400™ has just been upgraded to the first universal mini-disk storage system.

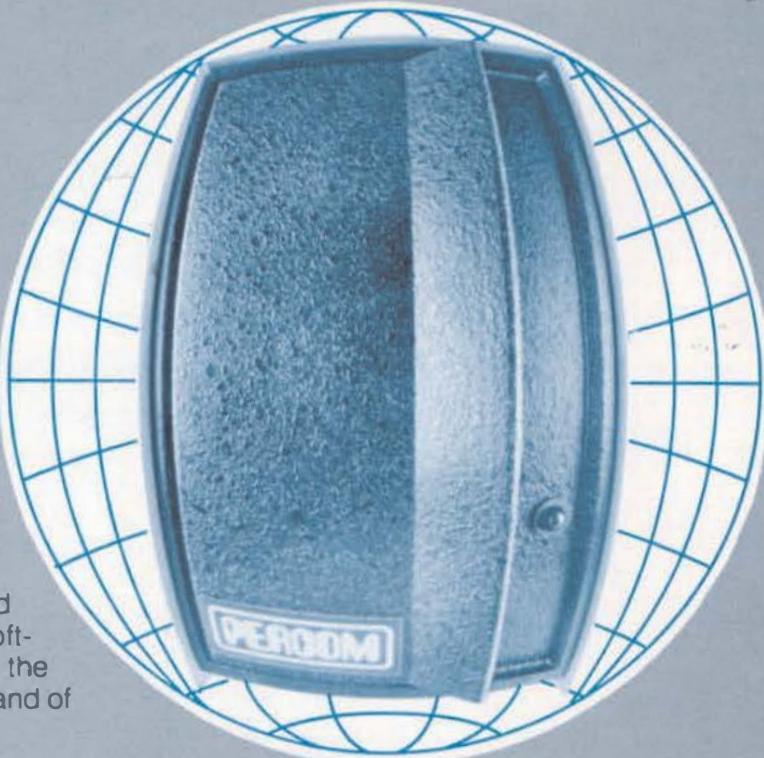

Suddenly the two worlds of 6800 minidiskette software become one. Because the LFD-400™ with SOFTRAN™ can read either soft-sectored or hard-sectored disks.

And owning an LFD-400/SOFTRAN system means you can run minidiskette programs from the enormous combined selection of all of the principal 6800 software houses — TSC, Computerware, the Software Works, Hemenway Associates and of course Percom.

Available in versions for mini FLEX†, FLEX 2.0† and Smoke Signal Broadcasting Company's DOS, SOFTRAN™ copies soft-sectored minidiskettes track-for-track onto hard-sectored miniskettes. If the source disk includes a FLEX† or 'Smoke' DOS, SOFTRAN™ is used to modify the operating system to function with the Percom LFD-400™.

SOFTRAN™ is supplied on a minidiskette along with utilities for only \$24.95. A users manual is included. You must indicate whether SOFTRAN™ is to be used for mini FLEX†, FLEX 2.0† or Smoke's DOS.

The Percom LFD-400™ mini-disk system sells for

only \$599.95, complete with: (1) the drive, drive electronics and Percom's rugged PS-401 power supply all in a finished enclosure, (2) a demonstrably superior controller PC card featuring an explicit data/ clock separation circuit, MPX, a remarkable 2K DOS, and provision for 1K extra PROM, (3) an interconnecting cable and (4) a 70-page users manual.

Also available: Upgrade kits for SWTP or 'Smoke' mini-disk drive systems. Kit includes LFD-400™ controller, MPX DOS & SOFTRAN™. Only \$224.95.

Available soon!

SOFTRAN™ for Percom's 77-track LFD-800™ mini-disk system; SOFTRAN/9™ for 6809 FLEX† files and programs.

A Few Extraordinary Products for Your 6800/6809 Computer

SS-50 Bus LFD-400™ and LFD-800™ Systems

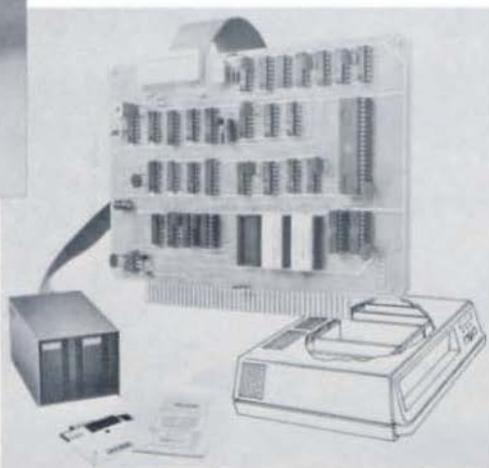

Percom mini-disk systems start as low as \$599.95, ready to plug in and run. You can't get better quality or a broader selection of disk software from any other microcomputer disk system manufacturer — at any price!

Features: 1-, 2- and 3-drive systems in 40- and 77-track versions store 102K- to 591K-bytes of random access data on-line • controllers include explicit clock/data separation circuit, motor inactivity time-out cir-

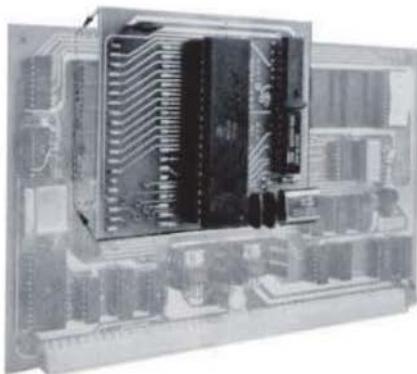

cuit, buffered control lines and other mature design concepts • ROM DOS included with SS-50 bus version — optional DOSs for EXORciser® bus • extra PROM sockets on-board • EXORciser® bus version has 1K-byte RAM • supported by extended disk operating systems; assemblers and other program development/debugging aids; BASIC, FORTRAN, Pascal and SPL/M languages; and, business application programs.

From Percom . . .

**Low Cost
Mini-Disk Storage
in the Size You Want**

EXORciser® Bus LFD-400EX™ -800EX™ Systems

This 6809 upgrade adapter may be used on the SWTP 6800 and most other 6800/6802 MPU cards. Supplied assembled and tested, it costs only \$69.95 with user instructions. The original system may be restored by merely unplugging the adapter and a wire-jumpered DIP header, and re-inserting the original components. Also available for your upgrade computer is PSYMON™, the Percom System MONitor for the Percom 6809 single-board computer. PSYMON™ on 2716 ROM costs only \$69.95 — PSYMON™ is also available on minidiskette, with source and object files, from the Percom Users Group.

Full Feature Prototyping PC Boards

Percom SS-50 and I/O bus prototyping cards include all of the features needed for easy, straightforward prototyping. Use wire wrap, wiring pencil or solder wiring. **Features:** Tin-lead plating over 2 oz. copper wets quickly, solders easily • provision for power regulators and distributed capacitor bypassing • SS-50 bus card accommodates 34- and 50-pin ribbon connectors on top edge, 10-pin Molex connector on side edge — costs only \$24.95 • I/O bus card is 1-1/4" higher than SWTP I/O card, accommodates 34-pin ribbon connector and 12-pin Molex connector on top edge — costs only \$14.95 • Both card designs accept 14-, 16-, 24- and 40-pin DIP sockets.

The Electric Window™: Instant, Real-Time Video Display Control

This VDC card resides completely in main memory so that control is accomplished instantly by direct MPU access to the on-board 2K character-store memory and the display control registers. Price is only \$249.95. **Features:** Programmable CRT controller chip provides extraordinary capability for software control of functions such as number of characters per line, number of lines displayed, highlighting and interlaced or non-interlaced scan • includes ASCII 128-unit character generator which generates 7-dot by 12-dot characters — lower case letters have descenders • provision for optional ROM for special characters/symbols • comprehensive manual includes full listing of WINDEX™, the Electric Window™ driver program — WINDEX™ is also available on minidiskette through the Percom Users Group.

Products are available at Percom dealers nationwide. Call toll-free, 1-800-527-1592, for the address of your nearest dealer, or to order direct.

SOFTWARE...

MSI has MORE!

**WE INVITE YOU TO LOOK AT OUR NEW SOFTWARE CATALOG
WHICH OFFERS NEW PROGRAMS FOR YOUR 6800 SYSTEM.**

*All FLEX™ Programs from TSC are now available for MSI Computer Systems.

*MULTI-DISK FLEX™ from MSI allows the use of any combination of MSI disk devices to be used simultaneously, including the HD-8/R 10 megabyte drive.

*SORT/MERGE Program can be used manually or within other BASIC or assembler programs to perform high speed sorts of data files.

*Hemenway Associates Software Products for use under FLEX™ are available on the MSI System.

*TRS-80/MICROSOFT BASIC - MSI BASIC Translator allows MSI users to run the large library of basic programs written for the TRS-80 and other similar systems.

*SOFTWARE LIBRARY Programs keep track of all diskette and hard disk directories, giving alphabetical listings of available programs.

*SDOS Operating System.

*MULTI-USER/MULTI-TASKING SDOS Operating System allows any user to perform edits, assemblies, compilations, or program executions independently and simultaneously.

*All MSI software is supported on four (4) disk systems: quad density minifloppy, single and double density 8" floppy, as well hard disk systems.

*Complete BUSINESS APPLICATION PACKAGES including sales order entry, accounts receivable, inventory management, purchase order entry, accounts payable, and general ledger are available on MSI hard disk systems.

*PLOTTING PACKAGE gives daisy-wheel printers the capacity to perform graphics operations.

*LETTERWRITER Word Processing Software allows the use of daisy-wheel printers to generate documents and to handle correspondence automatically.

SOFTWARE ANNOUNCEMENT

JCP

Job Control Program
By Peter Murray

NOW INCLUDES LIBJCP

The JOB CONTROL PROGRAM (JCP) reads a text file that contains the necessary input for a program and then supplies this input to the program in the same manner that an operator would have normally entered it from the keyboard. The file containing the input is referred to as the procedure file, and the program receiving the input is referred to as the calling program. A procedure file contains input for such calling programs as FLEX™, FLEX utility commands, and other development software.

LIBJCP is used as a FLEX™ command within a procedure to load and execute another procedure. At the conclusion of the called procedure, control will return to the calling procedure and execution will resume at the following the LIBJCP command.

JCP also provides for parameter substitution within the procedure file, special commands to control JCP program flow, and a means for recovery from processing errors. These features allow for commonly used file routines to be written as a generalized procedure that JCP will execute, unattended, simply by entering a single FLEX command.

PRICE \$89.95

See Review in July '80 '88 Micro.

REMOTE

Intelligent Terminal Program
By Tom Speer

REMOTE allows use of your 6800 or 6809 system as a terminal to a remote computer. REMOTE gives you access to the new, inexpensive time-sharing systems designed for home computer users, such as MICRONET or THE SOURCE, or any other time-sharing system. You can also use REMOTE to talk to another microcomputer system. All you need is your FLEX based 6800 or 6809 disk system, a serial interface, a modem, and REMOTE.

REMOTE is flexible. You can control its many features and options thru local commands at any time. Output from the host system (from the phone line) may be directed to the console CRT, the system printer, or a disk file, or any combination of the three. You can change parity checking, control character definitions, etc. You can read files from disk to the phone line under user control. You also can issue any FLEX command while you are not receiving data.

REMOTE is a terminal program designed to give you the utmost in flexibility and convenience with as many different timesharing systems as possible. It was written by Tom Speer, P.E., an Electrical Engineer with over twelve years of data communications hardware and software experience.

English Text Analysis Program
By Dale Puckett

READTEST is a must for all writers and writing instructors. Reads prose from disk file and tells how well it was written. Reports number of lines, words, sentences, personal words, affixes, average sentence length. Individual reports pinpoint trouble areas. Overall index tells who can read it and who would print it. Fast 6800 object code. Runs in FLEX™. READTEST, a 6800 assembly language program written by 68 Micro Journal Contributing Editor Dale L. Puckett, is such an indispensable applications program for all writers, fiction or non-fiction, student stories, news stories, reviews, novels, etc., from the disk file you prepared them on and tells you how well they were written. READTEST is a powerful tool designed to aid both the student writer and keep a running check on the experienced writer. It is a serious application of your 6800 microcomputer that will pay for itself with the first check you receive for a readable manuscript.

ESTHER
An exercise in artificial intelligence
By Dale Puckett

ESTHER is Eliza plus. Artificial intelligence in pure 6800 code. Her source shows you how. Her object will amaze your friends. ESTHER remembers names, drops them, uses the player's name, and even echos keywords. ESTHER identifies more than 75 keywords and uses almost fifty sets of replies. A few of the sets contain as many as 21 replies to help her avoid redundancy. ESTHER features auto line length and runs in FLEX™. She obeys TTYSET. She is both educational and fun. ESTHER, written by 68 Micro Journal Contributing Editor, Dale L. Puckett, is the result of a two year long experiment with artificial intelligence in 6800 assembly language programming. ESTHER randomly inserts the players name in the conversation. Occasionally, she uses part of the player's reply in the middle of her answer or next question. ESTHER has the ability to echo keys. This allows her to respond to replies from the player which are in the third person.

ESTHER identifies proper nouns and uses them in her replies. She also saves them for later use.

PHILLY SHOW

A grouping of FIFTY BUS exhibitors was organized into one section at the recent Personal Computing show held in late August in Philadelphia. This section was only for 68xx products, and was the largest area in the show. In addition to the exhibit booths there was a combination meeting and lecture area set up in the center. Speakers included Tom Hensen of Computer Consultants of Michigan, Dave Shirk and Den Vanada of TSC, Bob Bundy of Sonex, Ray Talbot of Kenyon, John Alford, Joel Heckman of Universal Data Research, Ken Kaplan of Microware, and Shel and Sam Epstein, with Don Williams serving as ringmaster.

There were 15 separate exhibit booths surrounding the meeting area in a town square type of setup. A synopsis of each booth follows.

Thomas Instrumentation highlighted Mark Sproul's fully automatic answer/originate Modem board. They also showed their new low cost video based 6800 system. Jan Guyas caught your reporter sneaking Tom 2 butterscotch candy balls. He gave back 4. For those of you who have spoken to Donna on the phone, she's even cuter in person.

Sirius Systems was staffed by Jerry and Leeh Robinson who will be having a Forth and a disk controller card for 6809 systems.

CSI's UCSD Pascal was shown by Dave Allen and Kathy Micken.

Universal Data Research demonstrated their Date Base Management System. Joel Heckman has put a lot of time and effort into the development of this, but give Joanne a lot of credit for her support to Joel.

Sonex System's Stylograph caused an editor of a computer periodical, who shall remain unnamed, to exclaim "I didn't know the SS30 had software." He later

explained that he meant good applications software, but admitted that his publication did not cover or solicit software reviews for our bus. He has promised to correct this in the future. This was the first show for Bob Bundy and the first chance for us to meet him in person. He's a quality guy, as is his software.

Kenyon Microsystem's demonstrated their Forth. Ray Talbot was one of the original developers of Forth, and his credentials and background are impressive, but in spite of that he is a real regular person. And a special thanks to Tom Kenyon who hosted a nightly cocktail hour in his hotel room where we could meet and decide where 20 some odd people could feed at one table. The job of Restaurant reviewer has been given to one Don Williams, so look for his column giving tasteful or tasteless suggestions on eating out in Philadelphia.

GIMIX' booth was staffed by Mike Magnus and Richard Don. They showed for the first time their new Disk Controller cards, as well as demonstrating GIMIX' version of TSC's Flex and Microware's OS-9 in use on their 6809 systems. Another GIMIX system was dedicated to showing their 512x512 high resolution graphics, which proved to be a showstopper. The other new GIMIX cards at this show were the 16 socket EPROM/ROM/RAM board capable of storing up to 128K bytes, and their 2 port and 8 port Serial I.O. boards.

The Microware booth was always busy. Ken Kaplan and Larry Crane had a field day demonstrating and teaching users how to use OS-9 and Basic 09. The sales and pending license agreements that resulted from the show had them beaming as they had proven that they have a winner. (note to editor-please identify Larry's photo. In previous story on S.F. Fair he was the unidentified faire goer. At this show he had a badge identifying himself as such) (OUCH! ye ole ed). Ken's

Sunday afternoon symposium in our meeting area drew the largest crowd, we had.

Another first time exhibitor was Star-Kits. Pete Stark of course is no stranger to users on the FIFTY BUS. This was his turn however to be on the other side of the table. Altho he expected the most interest to be in his software, it was his SBC-02 single board computer that stopped the lookers. At this point let me exercise my writer's privilege to digress into Pete's after show hours activities. First, thanks for sharing my double chocolate cake with chocolate ice cream. (note to our wives-we're only kidding) (Ed's note: NO he is not). Thanks for bringing your friend, Joe Melhado, whose stories and jokes can not be printed, but kept us drunk with laughter into the wee hours. Now if Don will only run that picture of Pete you readers will get a real insight into what Pete Stark is really like (Ed's note: It's here!)

The next booth we visit was staffed by Joyce Williams with some help from Don. You should have seen that gal sell old copies of 68 Micro Journal. It seems that once a new subscriber starts, he wants all the back issues. Joyce was there to open up with most of the rest of us bright and early each day. Not so with Don. He kept the rest of us up leading the bull sessions in the Hilton Lobby until early A.M. And then he slept in the morning while Joyce and the rest of us worked pie-eyed. Next year I'm going to hire Joyce away from him and get even. The real hero on Saturday was Ken Kaplan. He and Don were up until 5:30, and Ken was at the booth at 8:30. (Sunday was another matter tho, wasn't it Ken?) Also helping out at the 68 Micro booth was an old friend from past shows who enjoys himself so much that it rubs off on all of us, Joe Sobieski. One of the great enjoyments one gets from participating in these shows

Is the people you meet and get to know. Our Industry is in its youth, and it and the people involved in it have the vitality of youth and I know of no greater example than Joe (Ed's note; agreed 100%).

Hazelwood Computer Systems is another first timer. Dave Bridger showed (and sold the first day all the boards he brought) their new 256x256 graphics card. He and Mike Smith are winners. We have convinced them to go ahead with an IEEE 488 Interface card which we feel is needed for the bus and which is still in the preliminary design stages.

Frank Hogg cut his first set of teeth at this show. They demonstrated and answered questions on various new software written by himself, Pete Murray, Tom Speer, and Dale Puckett, none of who should be

strangers to readers of this journal. By the way, in case Don forgets to give photo credits, they belong to Dale Puckett and Mike Magnus.

The febe group showed the prototype of their FIFTY BUS mainframe with built in keyboard. It looks like a viable product and was well received by the viewers. Watch this journal for announcement of when it will be available. If the production models are equal to the prototype, I predict they will receive a very favorable review.

John Alford is another familiar face who for the first time was on the other side of the table. He received a lot of interest in his CONFORM and SCREDITOR packages. He is also a proud father and rightly so.

We end our tour with HHH. Tom Harmon and Dora Horne demonstrated their SPIRIT language and their ability to put it all together. They had a real nice color graphics demonstration. One of my personal highlights was when I introduced Bob Lenz of Microworks to Tom as Curt from Germany. Bob and Tom had been old friends over the phone, but had never met in person. But when Bob came out with "Vos Is los?", Tom cracked up and knew he was being had. To Dora went the honor of being "Miss NIFTY FIFTY."

A special thanks to John Dilks, the show's promoter, who cooperated in helping us have our own special section. He and Shery and Dave and Janis Jones arranged for signs, seating, podium, amplifiers, and other amenities that allowed us to create our own convention within the show.

EAT YOUR HEARTS OUT. Don Williams is jealous. Pete Stark gives a victory salute as Richard Don introduces Miss NIFTY FIFTY, Dora Horne.

The show is also people who attend. I personally met with dealers from England, France and Canada as well as the U.S.. Universities from Canada and the U.S. were represented. Other industrial users of FIFTY BUS products were in the fields of Aerospace, Nuclear Research, Military, Auto, Tire, Electrical Equipment, Communications, Security Systems to name a few who come to mind as I write this. I dare not list names for fear of leaving someone out.

We, as a group, created the impression among all the visitors to the show that the FIFTY BUS had the most to offer and the most advanced products. Our unified area was not only the largest, but had more variety and

Ken Kaplan of Microware addresses the largest turnout, for speakers. His subject was OS-9 and BASIC09.

Waiting for his turn on the podium is Dan Vanada of TSC. That's Matt Scudieri of Oak Ridge on the right.

more new products, both hardware and software, than any other bus. We generated among ourselves a new esprit-de-corps. At our Thursday night-Friday early morn lobby bull session one of our users was describing the accuracy and tolerances he needs and gets from his 160K 6809 system. The system is being used in the most advanced space age technology. The others present shared our pride and had their eyes opened to the potentials we have in the future. We have come a long way in a short time, but still have a long road ahead. We hope to have this user write an article in the future.

This show proved to exhibitors, visitors, and press what we can do when we present a unified picture. For the exhibitors it was profitable. The users got to see, use and question and learn about the latest in hardware and software in the most convenient manner. To the press and others not on our bus, it was an impressive job of public relations. We shall do it again next year.

Richard Don

Ed's Note: Due to space we will run some of the pictures indicated above in December's issue.

Support Our

ADVERTISERS!

Rumors?

The following is gathered from multiple sources and the accuracy cannot be verified for every item referenced. However, there should be more complete announcements to follow in future issues of 68 Micro Journal.

From Southwest Technical Products are some new CRT terminals and additional 5" disk systems. Some of the new 5" systems store more data than earlier 8" systems. Also nearing completion is a new text editor and output formatter (this is done on the formatter (preliminary version)). Uniflex for the SWTPC S09 systems is now being shipped. Also a new version of OS FLEX™ is being shipped by SWTPC and includes a host of new and useful utilities.

GIMIX is now shipping their new 6809 systems and CPU cards. Also in the next month or so they promise to begin shipping their complete line of disk controller cards, both 5 and 8 inch versions. Included is a 'DMA' 8 inch disk controller board, that will work with existing 8 inch disk systems.

We do not, as of this writing, have either the 8 inch version of OS9™ from Microware or Uniflex™ from TSC running. We hope to have them both running by next month and maybe I can let you know a little about each.

Look for a new 6809 computer from the ATARI folks. Look for 32K expansion kits, disks, printer and other products to be advertised soon. I feel that many of our S50 bus vendors should have a field day with this machine. No firm info but the rumors are fairly straight.

Published in this issue is as much technical data as we can scrounge up on the SAM MC6883 Synchronous Address Multiplexer chip produced by Motorola for the new Radio Shack TRS80C color computer, using a 6809E. This chip (6883) is a new device and has little (from reports gathered) field testing. Reports so far is that it runs 'hot' in the TRS80C and could possibly be a source of trouble. Later versions will take care of this problem.

From down Texas way (Digital Research Computers) come information of three new products for the S50 bus. A single board 6809 computer, I/O, 64K RAM (with provisions for extended addressing to 1 Megabyte), color graphics 'DAT' type monitor and other facilities including a video generator built in, rumored price \$795.00. A 64K dynamic board in kit, with sockets, to sell for less than \$300.00, with extended addressing. A 32K static, 2 Mhz, memory system for around \$400.00.

You 68000 buffs need to look into Hemenway's new 68000 O/S. It is reported to be DEC™ type in operation, but faster and with greater utility. Motorola seems to have wrapped up their deal with NCR and IBM for the special 'micro-coded' versions of the 68000.

All you folks over there around Phoenix that heard a loud rumble were not hearing buffalo stampeding; nope, it seems that some heads have 'rolled' because of the condition of the 68000 project. Seems now that there are some bad internal problems, both with the chip and the departments. Where are the support devices - for that matter where is the 'final' version (that works) of the 68000? We have not seen it yet. One thing for sure, when it actually gets here, it should be a winner, when it get here! More as I hear it.

Bear in mind that much of the above is unseen and as stated, rumors. However, I try to confirm as much as I can. Remember it was over a year ago that we told you about the Radio Shack 6809 unit, which is now being delivered. Some other editors and publishers were saying we were 'all wet'. Now we know!

Dixie

DIXIE is a new 'Disk Executive' for the Percom LFD-400 disk system just introduced by Blue Hat Software Company, Box 4127, Flint Mich. 48504. It differs from Percom as well as other 68xx disk operating systems in many ways and provides many new and useful functions. It provides dynamic allocation of disk space, multiple catalogs which are used to group together different files, 12-character file names, file protection facility, and space for 14 catalogs and 45 files. Its author, Larry Preston, is chief systems analyst at a large commercial Honeywell computer installation. It is easy to see that parts of DIXIE reflect his big-system outlook.

The Basics

Most of DIXIE is on a 2708 EPROM which plugs into the middle EPROM socket on the LFD-400 disk controller, replacing Percom's MINIDOS-PLUSX. Percom's MINIDOS EPROM stays on the board and provides the basic disk drivers and utility routines. In addition to the 1K on DIXIE's EPROM, another 1/2K of program sits on the disk, automatically read by DIXIE into its directory buffer area as needed. This part is called the 'transient driver'.

DIXIE requires a standard LFD-400 system with version 1.4 MINIDOS, a MIKBUG-compatible monitor, and about 3/4K of RAM just above the monitor scratchpad at A080. Any system which can run MINIDOS-PLUSX can also be used for DIXIE.

DIXIE is remarkably compatible with the basic Percom disk system and its software. Except for the fact that a DIXIE disk directory is different from a MINIDOS-PLUSX directory, each DOS can read the other's files. Thus disk conversion is not very difficult and a certain degree of compatibility exists as long as you have a printout of the disk contents. But the two operating systems cannot write on each other's disks.

(DIXIE even fits into disk systems which have Star-Kits' P-DOS Patch ROM, which adds read-after-write error detection and correction to the Percom system. With Percom's MINIDOS in ROM socket 1 of the controller, DIXIE in socket 2, and P-DOS in socket 3, the system just purrs along with all three ROMs working together although they came from different suppliers.)

Disk Organization

Percom's MINIDOS-PLUSX uses the first two sectors of track 0 for a directory, and leaves the other eight sectors blank (file storage starts at sector 0 of track 1). DIXIE, on the other hand, makes use of all ten sectors of track 0.

Before a disk can be used under DIXIE, it must be initialized with the INITDISK utility. This utility initializes track 0 of the disk in DIXIE's special way. Thus the disk contains part of DIXIE and a variety of additional information, yet has the same storage capacity as a disk formatted by an unmodified MINIDOS-PLUSX.

Initializing a disk writes the following information on track 0: Two sectors hold the DIXIE transient driver. This 1/2K program segment loads over the directory area as needed to expand the length of DIXIE yet conserve on ROM space.

Two sectors contain a sector map and disk label. The sector map contains either 350 or 400 bytes (depending on whether a 35- or 40-track drive is used), where each byte corresponds to one sector of the

disk. If a given byte has a 0, that means the corresponding sector is empty. A non-zero number signifies that the sector holds part of a file, and the number in the byte is the number of the file (which is keyed to the file number in the directory).

Here is a major difference between disks written under MINIDOS-PLUS and DIXIE. MINIDOS-PLUS disk files always occupy a group of consecutive sectors. Although MINIDOS maintains forward and backward pointers on each sector so that theoretically files do not have to be in consecutive sectors, in practice MINIDOS-PLUS will always place them that way. Moreover, when a file is deleted, the released sectors are added to the free space only if the file was the last on the disk. Otherwise the released sectors are left blank.

In DIXIE, however, released sectors are marked with a 0 in the sector map, and the very next SAVE command can re-use them even if they are in the middle of the disk. Moreover, a file can be split up into non-consecutive sectors if it does not fit into a single available space. DIXIE simply searches the sector map sequentially for empty sectors, saves the file into them, and lets the standard MINIDOS backward and forward pointers tie the sectors together into a chain.

Thus DIXIE provides the same dynamic allocation scheme as Flex, SSB DOS, and other advanced systems do, but in a different way. In all of these, files can be spread out over many non-contiguous sectors on the disk. In all of these, the directory points to the first sector of each existing file, while each sector points in turn to the next sector in the chain. The last sector has a pointer of 0, which signals the end of the chain. When a file is read sequentially, the DOS follows the pointers to the end.

The difference between DIXIE and other 6800 disk operating systems is in its handling of the empty sectors. MiniFlex, Flex, and SSB DOS treat the empty sectors as just another file which happens to consist of garbage. The directory points to its first sector, and each sector points to the next empty one. When a file is deleted, its sectors simply get added at the end of the string. After many deletions and additions, the chain of empty sectors can wander back and forth over the disk. When a new file is written, the disk head may have to go in and out many times to follow the chain.

In DIXIE, on the other hand, there is no chain of empty sectors. Instead, empty sectors are flagged in the sector map with a 0. When a file is deleted, its sectors are flagged with a 0 and simply added to other adjacent empty sectors. Then, when a new file is written, DIXIE starts grabbing unused sectors, starting at the outside tracks and going in. Thus reading or writing a long file is inherently faster, since the amount of head seeks is minimized.

Similar time savings exist in other operations. For example, when Flex deletes a file, it must step the head to inner tracks of the disk in order to update pointers. DIXIE, on the other hand, just changes the sector map and rewrites it.

Since the sector map uses just part of two sectors, DIXIE also stores a disk label into the same area. Whenever a disk is initialized, the disk is given a number and name; each time a drive is accessed, DIXIE prints out this information to confirm that the correct disk was mounted.

The remaining six sectors of track 0 hold the actual directory information. There is a main directory and up to 14 lower-level catalogs. Whenever a file is saved on a disk, it is either assigned to one of the 14 catalogs, or uncatalogued. The disk contains a one-sector catalog directory which lists the names of all the

catalogs, and a five-sector file directory which holds the names of all files, their file number (which is keyed to the sector map) and their catalog number (which is keyed to the catalog descriptors, and indicates which catalog holds that file). A file assigned catalog number 0 is assumed to be uncatalogued.

When DIXIE's F (Files) command is used, the directory printout provides the listing of all catalog names, as well as a listing of uncatalogued files. When the F is followed by a catalog name, then only the files belonging to that catalog are listed. Hence a disk directory listing can contain just selected classes of files.

This is a concept which is borrowed from much larger systems which may use multi-megabyte hard disks. The idea is that all Basic programs can be assigned to one catalog, all assembly language source programs to another, object codes to a third, and so on. Utilities which are commonly used would be uncatalogued and accessible outside each catalog. (The next extension would be to assign access codes so that each user could have access only to specific catalogs, but all users could access uncatalogued files.) In this way a directory printout would contain only files of interest, rather than all the (possibly hundreds) of files that a hard disk can hold.

While elegant, this idea has limited use with single-density, single-sided mini-diskettes. Since such diskettes have limited storage, are easily interchanged, and are even quite cheap, most disk users have long ago learned to devote different disks to different types of files. But if DIXIE ever gets adapted to a hard disk...

DIXIE Commands and Utilities

DIXIE has the following commands: C - Create a file. Puts the file name into the main directory or into one of the catalogs, but does not assign any disk space. D - Create a catalog. Assigns the catalog name, but leaves it empty.

F - Files. Prints a disk directory or directory of a catalog. The directory contains the catalog or file name, file number, file size and file type, beginning, ending and transfer addresses, and first disk sector.

J - Jump to a memory address.

L - Load a file but do not run. A file is generally loaded into the same area it came from, but can be loaded into a different location.

N - Rename a file.

O - Rename a catalog.

P - Protect or un-protect a file.

A protected file can be read or renamed, but not deleted or rewritten.

Q - Query a disk. Prints out disk name and number, and number of free sectors.

R - Delete a file and release its name.

T - Delete a catalog and all its files (unless protected).

S - Save contents of memory (and a transfer address) to a disk file.

Whenever a file is saved whose name already exists on the disk, the prior file is removed (unless protected) and the new file substituted (even if it is larger or smaller; only as much space as is needed is allocated.) Note that the file must be created with the C command before it can be written to, a minor inconvenience which takes a bit of getting used to.

When any other entry is typed, DIXIE searches the disk for a file by the same name and executes it if present. Thus user programs, or disk-resident utilities are executed by typing their name.

(A complete file description consists of #drive-number /catalog-name file-name . where the #drive-number can be omitted for drive 1.

and the /catalog-name is omitted for uncatalogued files. The catalog-name and file-name can be up to 12 characters long and contain letters, numbers, and most punctuation symbols.)

The DIXIE EPROM comes with three disks which contain source and object code for DIXIE itself, for several disk - resident utilities, and for patches to other programs. The disk - resident utilities include INITDISK for initializing a disk, NEWLABEL for changing a disk label, SINGLECOPY and DUALCOPY for copying entire disks using one- or two-drive

systems, FILECOPY for copying single files, and PDIXD for printing a formatted disk directory on the terminal or a printer.

Program Patching

Since DIXIE files are dynamically allocated space as needed on a disk, with consecutive sectors linked via the MINIDOS forward and backward pointers, they can be read by either MINIDOS or MINIDOS-PLUSX (assuming that the starting sector of a file is known.) But they cannot be written that way since neither MINIDOS nor MINIDOS-PLUSX has any way of knowing how many sectors are free, or whether a given sector is assigned to a file or not. Hence any Percom program that writes on the disk must be patched to use named files via DIXIE.

Supplied with DIXIE are patches for Percom's HEXLDR, Assembler, and Touchup editor, as well as for the cassette versions of the TSC Editor and TSC Assembler, and for SWTP cassette Basic version 2.0 and 2.2; the latter allows program storage but not disk files. (An essential patch for Percom Super Basic is in the works and should hopefully be available soon.)

When this is done, these programs prompt for a file name (preceded by drive number and/or catalog name, if applicable), and then print out the disk label to make sure the correct disk is used. If desired, the standard DSSS Percom format can also be used for input files, so that files can be read from unformatted disks, or from MINIDOS-PLUSX - formatted disks.

Some Percom programs, such as the text processor, or DSKMAP, will work without patching since they only read files using the DSSS format. Since the DIXIE directory printout gives the starting sector for all files, this information can be given to these programs.

Those Percom programs (or programs patched by Percom) which write on a disk but use only DSSS format can still be used, but only via MINIDOS itself, not DIXIE. This might include A/BASIC or a disassembler, for instance. A user would have to be careful to use un-formatted disks (not DIXIE formatted disks), and could then transfer resulting files to a DIXIE disk with the FILECOPY utility. This process is inconvenient, but at least tolerable if it is not done too often.

Overall Conclusions

DIXIE is quite reasonably priced at \$60 for the 2708 EPROM, three disks of code and patches, and a quite comprehensive user's manual. The manual contains complete instructions for using DIXIE and applying the supplied patches to existing software, as well as a good description of how DIXIE works. Since all source code is supplied on diskette, it should be easy to study or modify the system if desired.

The only question each user has to answer for himself is whether the conversion from MINIDOS-PLUSX to DIXIE will justify the time expended in translating disks and learning a new system. (Larry Preston plans to produce a utility to convert MINIDOS-PLUSX disks

to DIXIE format, but it is not available at this time.)

With the exception of Percom Super Basic, other Percom programs running under MINIDOS-PLUSX use the DSSS format rather than named files. This means that a slip of the finger, or a slight mis-calculation, can store one file on top of another.

DIXIE to a large extent eliminates that possibility - at least for those programs which are patched to run under DIXIE. With DIXIE's dynamic allocation of disk space, one named file should never overwrite another. On the other hand, unpatched programs which still use the DSSS format require extra special care now, since DIXIE files can be spread out over many sectors and tracks, in places where you'd least expect them.

For many years, proponents of other disk operating systems have looked down at the Percom disk system and called it a fast cassette system rather than a real disk. They should look at DIXIE, for it gives them most of the features they have always been missing, and does so at a fair price..

XREF

Not part of DIXIE, but also available from Blue Hat Software is XREF, a patch to the Percom Assembler to produce a label cross-reference printout at the end of assembly. XREF is enabled by the OPT XRF statement (which is selected by default), and disabled by OPT NOX. When enabled, the assembler assigns a line number to each line of program, and at the end prints a listing which shows for each references label (a) the line in which it is defined, and (b) all the lines in which it is used. At \$15 for a disk which contains source and object code for the patch as well as a manual, XREF is a valuable addition for the heavy assembly language programmer.

CONTEST Notes

SOME NOTES ON SOFTWARE CONTEST

The following was attached to one of the contest entries. "This program hasn't been previously published in any commercial magazine or journal and is the "soul" property of xxxxxxxxxxxxxxxxx". Note: the ("s") are added. Such were the feelings of one contest entrant. No doubt most all who entered had some feeling about his or her entry. After looking over a majority of the entries I must admit that I can fully understand the above.

When it all started, nearly a year past, I just did not know what to expect. A good thing, if I had known, I probably would have had second thoughts. Now however that it is 'nearly' finished, I feel a lot better about the contest and the interest it generated. Not all categories were sufficiently filled with winners (or entries) for all the prizes. A couple had an overflow of entries. Also some interesting percentage figures emerged as a result of the number of entries, per category. All in all it was enlightening and gave me a good overview of what we should do, in case we ever try another contest.

One thing became apparent, especially as things begin to drag a bit. First, I began to realize (should have known from the many buckets of sweat I have shed on some programming project) that, in many if not most cases, the "special" beauty of a program is in the eyes of its creator. As the local judges (we used 6 local 68XX users to judge portions of the entries) came together, after reviewing their respective

charges, each with some decisions made, it became apparent that not everyone views the merits of a particular program to the same degree. In fact it was difficult, at first, to believe that we would ever get it finished. We even nit-picked some. I stayed out of all final decisions. If I felt that some particular program was lightly or heavily dealt with, I would gather another committee, of the judges present, or occasionally had to get on the phone to some that were not present), and have them give a second opinion. Sort of like a medical conference. We would take their opinions back to the rest of the group, again sometimes by phone, and finally each entry fell into its place of judgement. I can tell you this, none of us agreed that the final results were as we would have personally preferred, however, I honestly believe that the decisions were as fair as any committee could arrive at. Such is the penalty of group action; honest, fair but cumbersome.

Anyway we have all the local judging finished and are waiting for two categories, being judged in different parts of the country, to be returned. This means that I can get it finally wrapped up (?). The thing that I hope does not occur is that any one gets his or her feelings hurt. I am sure that some who ended up in one position could have well been in another (better or worse) position, had other judges evaluated their offering. I have even received phone calls and letters from friends of some who entered, extolling the virtues of a particular entry, their friend's. For this reason, as well as others, I had no hand in any FINAL decision. When the final results are published, hopefully next month, the die will be cast. No appeals or reviews, right or wrong, the judges decisions will stand!

More will be expounded upon next month (?), but for now I just want to heartfully thank all who entered and all who supported this effort by their donations. I honestly believe that we are all a little closer as a result of those involved.

As for the prizes, excluding those from 68 Micro Journal (subscription winners to be notified from here), letters will be mailed to all donors requesting that they forward their particular prize on to the winner. Also the occasional use in this column of the character (?) is mainly due to the feeling I had, at the beginning, that we could get it finished in 4 or 5 months. Oh well, what was it some one said about 'the best laid plans of mice and (?)'.

FLEX User Notes

BY: RONALD W. ANDERSON

ANN ARBOR, MI 48105

One of the most prolific of the suppliers for 6800/6809 software is Technical Systems Consultants of West Lafayette Indiana. One of their newer offerings is their Flex Diagnostics Package for 6809. This package includes a series of memory test programs and a group of programs for checking, diagnosing and repairing disks that have "crashed". The manual that comes with the programs is 100 pages long. Though TSC has always produced a better than average manual, their trend is to better and better documentation. This time they have done extremely well. The manual is much more than instructions for the use of the diagnostic programs. It contains long discussions of memory organization and of the types of failures that may be encountered. It points out that dynamic memory has different modes of failure than static memory, which is the reason for the inclusion in the package of a dynamic memory test.

The diagnostics are roughly divided into two equal groups. The first is the memory test group.

It is pointed out in the manual that different modes of failure are detectable by different test methods, and the manual recommends the order in which to try the test programs to try to find a bad memory chip. The tests are listed here with a description extracted from the TSC information.

CONVERGE - used to detect address or data lines that are shorted together.

DYNAMIC - for testing of dynamic memory of course.

QUICK - a check that reveals "solid" failures. It runs very fast.

RANDOM - a slower test that shows up more subtle failures. Essentially test of memory with changing random pattern.

WALKO - test in which only one bit in the memory being tested is a 0.

WALK1 - inverse test of WALKO.

Each of these tests takes longer than the previous one in the list. Some of you may have the TSC diagnostics package that is compatible with the AC-30 cassette system. These tests are similar in result, but they are completely new in terms of operating with the disk system, messages that they present, and in the ease of escape from the tests back to FLEX. All of the tests recognize when FLEX has been overwritten, and warn you of the fact, then exit to the monitor when they are finished.

The other half of the diagnostics as I said above, is the Disk Diagnostic Package. Here again, TSC has provided a short textbook on how a FLEX disk is organized, and what some of the failure modes are. There are 10 programs for diagnosing and solving disk problems in the package. TEST is a fast program that checks for bad spots on the disk. FILETEST does the same thing but indicates in which files the bad spots are located. VALIDATE looks for discrepancies between the file and the information in the directory, intersecting files, etc.

Four of the programs are used to recover data from damaged disks. TSC does stress the fact that a good backup is the best way to recover from a disk failure, but the utilities given here allow for the recovery of a single file, or a try to reconstruct all the files on a disk, even if the directory is "wiped out". REBUILD and RECOVER are for the recovery of files from such a disk. REBUILD will attempt to save all the files from such a disk, while RECOVER allows specification of which file to save, however, requiring that you specify the starting track and sector of the file. RAWCOPY will copy a file with a checksum error, to a new file. This would be of most use in recovering a text file. The damaged area will still be damaged, but the text editor may be used to repair this area if it is not extensive. UNDELETE does just what it says. When a file is deleted, the sectors that it occupied go back into the free chain at the end. Therefore, the most recently deleted file becomes the last area to be written over. There is therefore a reasonable chance that the last few files deleted are still intact, particularly if the disk is not too full. This utility will indicate all the intact but deleted files and allow you to "dump" them to the terminal in an effort to determine which is the one of interest. You may then recover any of them, specifying a filename for the "undeleted" file. I know of one case where a few hours of typing could have been saved with such a command. An operator was using the text editor and processor, and had been working for some time on a file when the power failed. When power was restored, the operator tried to edit the backup file but mistakenly didn't rename the file from .BAK to .TXT. When the editor asked "DELETE THE BACKUP FILE?", the operator responded with a Y, and deleted the backup. The new file was not written when the power failed and the file was lost. Not only did the last edit session have to be redone, but a whole large file had to be retyped. UNDELETE would have allowed recovery of the backup at least, and only the last edit would have been lost.

COPYR is a special utility used to rebuild a sector map for a random file that has been recovered. FLAW is used to remove an

"Intermittent" sector from the sector map of the disk so that the remainder of the disk may be used. EXAMINE is in a class by itself. The Flex Newsletter 2 from TSC had a "Dump and Repair" utility. My newsletter had a FILEPAT utility. This one is a combination of the two and about 4 more. It allows you to look at any sector on the disk, and make byte by byte changes. It does this by reading the sector to the sector buffer in the FCB, and allowing you to edit the information there with a function like the memory examine and change function in SWTBUG and SBUG-E. No changes are made to the disk until you have had a chance to make the desired changes and dump the sector to the screen again to see if all is correct. You may then write the sector back to the disk or abort the change. There are many ways of moving from sector to sector on the disk. The user is fully prompted for the required input, and like all the other utilities of this package, there are numerous messages generated by this utility.

Those of you who have read my reviews before in other publications and my newsletter, know that I am not always totally complimentary of software that I review. I would have to try very hard to find something to complain about. Perhaps it could be said that the price for the package seems kind of steep for the number of sectors of program on the disk. On the other hand, someone said that good things come in small packages. If you can recover a disk file, or find a memory problem and get your system back running with this set of utilities, perhaps you will save the cost of them the first time you have to use the package! We all know that we should keep backups of our disks, but how many of us back up our system disk every time we add a utility or make an improvement? In, say our startup file? I find out how sloppy I have been when I lose a file and the backup has 40 sectors less than the disk it is backing up! I can't give this one less than an AAA rating, both for the documentation and the programs.

MORE ON PRINTER MODES

In an earlier issue, I published the "U" utility group. In the discussion of its uses, I mentioned the H sub-utility being used to output control characters to the printer. This month, you will note the listing of the SET utility. While this is written expressly for the Paper Tiger, I am sure that any of you with a little Assembler programming experience could use it as a model for another set of control characters. As in the U utility last time, I've used a set of single letter commands that follow the filename SET on the command line, to provide for setting the various modes of the printer. I've tried to use letters that could represent the various modes, such as X for extra wide, s for Skinny, etc. There is also a C for Clear, that returns the printer to its normal status. This utility assumes that you have previously loaded PRINT.SYS either by having used a command with a P, preceding it, or by using GET PRINT.SYS. It checks to see that PRINT.SYS is loaded and issues an error message if not. This means that you don't have to use P before SET. SET W will set the printer to 10 characters per inch. Note that these work in a TSC BASIC program also, using the EXEC command. This means that you can change your printer mode under program control in a BASIC program.

Incidentally, there is one sure way to have previously loaded PRINT.SYS when you use the SET utility. Your STARTUP.TXT file could contain the line GET PRINT.SYS.0. Whatever combination of features your printer has, you may make them available to you at the DOS level, and to all your TSC BASIC programs. You will notice that the same technique was used here as in last month's U utility for finding the proper entry point in the program from the command letter. The letter is compared to the first of each three byte group in the JTAB at the end of the program. If and when a match is found, the starting address for that segment of the program is found in the next two bytes, by a LOX 1,X instruction, and then executed with a JMP 0,X. Several bytes of program were saved by using a common output character routine at the label OUT. All of the set commands branch to this point after loading the A Accumulator with the proper control character. Here, there is a JSR POUT to the print output routine, and a JMP WARM to get back to FLEX.

You will note that I have used a FLEX2 equate file for the equates. Simply by using a FLEX9 equate file, this program could be assembled with the 6809 Assembler, and would run in the '09 system as well. As I am writing this, it occurs to me that this is the only necessary change to get FLEX2 utilities to run in 6809. Of course, the '09 utilities ORG at \$C100 and the FLEX2 utilities at \$A100 so that the ORG would have to be changed. TSC supplied manual on the Assembler describes the Library feature, as did this column last month. The library file does not, in fact must not have an END at its end, or the Assembler will stop assembling at the end of the library file. The library file must contain just the lines that you would normally want inserted at the point where the LIB instruction is inserted in the program.

I thought it might be informative and educational to present the SET program here in Pascal and BASIC. First of all, it does not make sense to write the program in a BASIC interpreter, because then you'd have to load BASIC just to set the printer mode. Some of you have Microware's A/BASIC compiler, and for those of you who don't, it is a subset of BASIC, and the exercise might be informative. The largest limitation to A/BASIC is (at least for present purposes) that it does not allow a statement after an IF - THEN. You may only go to another line or to a subroutine. I have written two programs to show some alternative ways of using BASIC. The problem to be solved with this program is one that may be generalized to a type called an N way branch. We want to examine an input to see if it is one of several possible values, and take a different action for each possibility, including reporting an error if it is not one of the valid inputs.

The program SETBAS uses a peek and poke to control the output such that the prompt for the command goes to the terminal, but the output of the control character is to the printer. You must use the P, preceding this program, i.e. P,SETBAS. The program prompts for the command letter, outputs it to the printer and returns to FLEX. The letter input in response to the prompt is simply tested in turn for each of the valid values, and a jump is made to the proper output response line when a match is found. If no match is found, an error message is printed and the prompt is output again.

SETBAS1 is an alternative way of doing this comparison. It uses the "if not then skip" approach. The result is a little cleaner, but not any easier to follow. What is needed here is a way of making a multiple choice. There is the ON GOTO statement in BASIC, but that only works on consecutive numbers starting at 1. WE could use a series of statements in A/BASIC, that would assign a value to a variable Q, such as (rather than line 51 being PRINT CHR\$(28)), let line 51 be Q=1, etc. for the other values of MS. Then, you could ON Q GOSUB 60, 61, 62, 63, 64, 65, 66, 67. These lines could print the various control characters. This arrangement, while a little more structured, would mostly serve to make the program a little longer. Of course, in a BASIC that allows statements after an IF MS="X" THEN PRINT CHR\$(28). This would be a bit simpler because the number of GOTO's would be greatly reduced.

Pascal has a simpler solution, or at least one that is more structured. The Pascal CASE construct is just like the ON GOTO, in that it is our N way branch. Pascal, however, allows integers, characters, or TYPE variables in the CASE statement. Without getting into the subject of enumerated, scalar, or TYPE variables in Pascal, the Character variable use here will work fine. It is also possible in Pascal to define constants with names just like variable names in BASIC. The names or identifiers as they are called in Pascal, may be long, but only the first 6 characters are used by the program. (This is a limitation of Luciddata's implementation of Pascal, and not necessarily true of all implementations). By assigning values to names, the program makes more sense when we try to read it. This Pascal also allows hexadecimal constants. They are identified as in the Assembler, with a dollar sign. It makes more sense to write POKE (\$WITCH, ON), than to write POKE (-21470, -1), though they are equivalent.

You will note that the control characters have been defined too. WRITE is equivalent to PRINT in BASIC, and READ is equivalent to INPUT. The CASE statement is almost self explanatory. Which ever "label" matches the input character, its corresponding statement immediately to its right, is executed. All CONSTANTS and VARIABLES must be declared at the start of the program, and their types given. An attempt to use a variable of the wrong type, eg. to add a character to a number, will result in an error when the program is compiled. All the Variable declarations may look like a pain when you start using Pascal, but you will soon find that they allow the compiler to catch many of the "dumbs" that we all build into a program. By the time your program has made it through the compiler with no errors, it will be pretty close to running properly, though not necessarily error free.

THE 68000 PROCESSOR

Please consider this to be my personal opinion. I will be glad to receive contrary opinions from readers. Today, I attended a Motorola Seminar on the 6809 and 68000. The emphasis was on the 68000. Motorola has a great deal at stake in this development. They now have an EXORmacs development system for the 68000, though there are still available a number of cross assemblers and compilers to run on other computers, including the Exorciser 6800 system. The 68000 is a 16 bit processor with 32 bit capabilities just as the 6809 is an 8 bit processor with 16 bit capabilities. Motorola has extensive plans for a line of "Micromodule" cards for the 68000, though they are 14 1/2 inches by 9 1/2, so they don't look very "micro". Incredibly (to me) they are still not providing any high level software with floating point arithmetic capabilities. It is certainly because of the applications in which I am involved, but I can't see why anyone would need a processor as powerful as the 68000 if they were not doing calculations of some magnitude. They are planning a version of Pascal with REAL (floating point) variables if they see a demand. (Interestingly only about 5% of those attending indicated a need for it). Motorola has a PL/I for the 6800 and 6809, and will extend it to the 68000 also, but it has only integer arithmetic too. They do have a very powerful assembler in the mill for the 68000 with (strangely) a few of the higher level constructs such as DO WHILE, REPEAT UNTIL, IF THEN, etc. These will take care of loop construction in the assembler, and make the loop exit condition tests work correctly for the programmer. They admit that this is somewhat a reversal of the normal philosophy, but it sounds like it may be a very good feature.

All the software that is planned for the 68000 is planned in a 6809 version too, so there will be a great deal of support for the '09. In addition to the software support, there will be a lot of new peripheral chips for use in larger systems. There is a memory management chip, a combination PIA-timer, DMA controllers, etc. The 68000 has many features that were put there to make it easy to implement higher level languages. There is in addition to a 16 bit multiply, a divide instruction. In fact, there are signed and unsigned multiply and divide instructions. Instructions work at the bit, byte, word (16 bit) and double word (32 bit) level. A friend who works with an LSI-11 indicates that the two are very similar in capabilities and instruction sets. It will probably be one to two years before any of this filters down to the hobbyist level. Some of the chips and software are a year away as of this writing (May). The 68000 sold for \$250 a few months ago, but the current price is \$180. What "scare's" me is all the hardware support required. The 68000 can address 16 Megabytes directly with its 24 bit address bus. The data bus is 16 bits, but N by 8 memory can be accommodated, and is planned for at this point.

I guess, to sum up my impressions, very few of the people at the seminar, and I have no idea how many are currently 6800/6809 users, are using the current devices to a small fraction of their capabilities. Perhaps there were many present who don't now use Micros. It would seem to me that more would be accomplished by using the 8 bit micros capabilities, and pushing these a little before jumping into twice the hardware, four times the complexity, and who knows how many times the cost, to do the same job. With 16 Megabytes of

addressable memory, who will bother to write efficient compilers? The end of all this will be tremendously complex systems that no end user will be able to understand or maintain. The large increase in hardware will result in a large decrease in reliability at the same time. Don't get me wrong, I think there are good applications for 16 bit machines, and even the 32 bit processor that Motorola is undoubtedly working on, but these are not the same applications for which the 8 bit machines are ideal. Motorola should be aiming the larger processors at the market in which they are necessary to do the job. For example, complex NC machine controls, not those in which each move is programmed by a punched tape, but those into which the part parameters are programmed and the motions are calculated in real time. Here speed is important. Some of the present machines are rate limited by the calculation time. How about Business applications? If Radio Shack can sell a TRS-80 system for a small business, and they do seem to be doing so with some good results, how about a 68000 system for a medium sized business? How about a time sharing system for, say, a college Chemistry Department? One of these systems would be ideal for a medium sized Engineering Department for design work. All these applications imply the availability of fully implemented or nearly fully implemented versions of the common programming languages.

Now that I've climbed on my soapbox for this time, I'll get off, and see what kind of response I get. See you all next time.

A final note, apparently Lucidata Pascal does not use the normal FLEX routines PUTCHR and GETCHR for its I/O, and the SET program in Pascal, though it does set the printer mode properly, does not switch the prompts to the terminal as planned. Pascal has an overlay to tie in a printer, which I have not yet implemented. The program serves as a better example as is, since it implements the same functions as the one in A/BASIC and the assembler version.

MODEN INPUT AS A DISK TEXT FILE 4-16-80 1SC ASSEMBLER PAGE 1

HUMBUG

HUMBUG - A NEW 6800 MONITOR
 by Dale L. Puckett

This month we look at HUMBUG, a new monitor which should prove to be a lot of help to the 6800 user programming in assembly or machine language without the benefit of a disk system.

HUMBUG was written by Pete Stark and is available from STAR-KITS, P. O. Box 209, Mt. Kisco, New York, 10549. There are 2K, 3K and 4K versions burned in 2708 or 2716 EPROMs. All versions come with a complete source listing.

The 2K version in a 2716 sells for \$40. The 4K version is \$65. In the 2708 form HUMBUG will cost you \$45 for the 2K version, \$60 for 3K of code and \$75 for 4K.

The source code listing is available on FLEX 2.0, mini-FLEX and Percom disks, and on paper. The listing costs \$20. The source on disk costs \$25.

The 2716 versions were designed to work on the SWTPC MP-A2 CPU board. If you buy the 2708 version, you must supply a separate EPROM board.

COMPATIBILITY

HUMBUG maintains all of SWTBugs major subroutine entry points. This allows all of your old programs to run without change. Also, the SWTBug scratchpad addresses were left intact.

HUMBUG gives you full control over the system from your keyboard. You can even turn various ports on and off during the execution of a program. Another feature allows you to abort programs from the keyboard without pushing the RESET button.

Additionally, Stark has added extended debugging facilities. These include an impressive handling of multiple breakpoints and a special single stepping mode.

MIKBUG and SWTBug both used one stack. HUMBUG uses two. By keeping the user and monitor stacks completely separate, Stark has insured that the two will never clobber each other. ▶

I/O SCHEME

HUMBUG uses port 1 for all monitor input and most output. An ACIA such as the SWTPC MP-S or Star-Kits CT-PS card must be installed. This monitor uses an address called PORADD to allow you to redirect the control port by simply changing the \$8004 at PORADD to the address of a port where you have installed a serial interface card.

It is also possible for HUMBUG to output to a second serial card installed at port 0 or to special

output routines like those that drive my IBM selectric. HUMBUG continuously checks the control port for an ASCII DC3 or XOFF character (control-C). When it receives this character it echoes a BELL and stops all output. It then inputs one more character to check for any port change commands.

Options include: "O," which toggles port 0 on and off; 1, which does the same for port 1; D, which turns the special user written port routine on and off; and P, which turns the pause mode on and off. This mode is used for video terminals and stops the output automatically after every 16 lines.

If a carriage return is received immediately after the XOFF the program is aborted and control returns to HUMBUG. Unless, that is, the program has changed the address in HUMBUG's return address pointer to send control back to itself. Stark didn't miss a thing.

COMMANDS

Because of the excellent prompting this monitor is almost foolproof. For example if you type AD which is HUMBUG's command for a formatted ASCII dump, it will ask you FROM and wait for you enter an address. Then, it will ask you, TO. After you type this second address your dump will begin. And check this, if you are working with the same block of addresses you may simply type a carriage return instead of the FROM address.

The AD command prints the starting address of the dump at the beginning of a line followed by the ASCII characters for the next 16 bytes. If a location has a value of less than \$1F, a period '.' is printed. Also, the parity bit is ignored by this dump routine.

Let's look at the rest of HUMBUG's commands now. They are in alphabetical order in the fine user's manual supplied by STAR-KITS. We will leave them that way here.

"AI" is the command to input an ASCII string. It prompts you for a FROM/TO pair after which you simply type in ASCII characters. If you type more text than you have allowed space for when you answered the FROM/TO prompt, the routine will begin printing ERROR on the screen until you type XOFF.

If you run out of text before you run out of allotted space, you may simply type XOFF/CR. When you do this, HUMBUG will automatically change the FROM/TO pair so that if you wanted a dump of the area to check the accuracy of your typing you could simply answer the FROM prompt with a carriage return and you will automatically dump the correct portion of memory.

"AO" stands for ASCII output and allows you to output the contents of memory to port 1. It uses the FROM/TO prompt and is very useful for copying tapes, etc.

Typing "BP" will give you a listing of the four breakpoints that you have set. It gives you the address and the opcode or instruction normally stored at each breakpoint.

"BR" is the command that allows you to set breakpoints. It prompts you for the number of the breakpoint you wish to set or change and the address you desire to change it to. If you enter a CR to answer the address prompt the breakpoint will be removed. If you enter a valid address, that address will become a breakpoint.

"CL" will clear the standard SWTPC terminal screen. It outputs a \$10, \$16 string. "CO" allows you

continue execution of a program after reaching a breakpoint. It also allows you continue at full speed after a sequence of single step operations. You must however, remove the breakpoint before continuing or you will not be able to proceed.

Typing "CS" will print a 16 bit checksum of the area within the FROM/TO range. You are prompted for the FROM/TO values.

"DE" is the command for a mini-disassembler. It prints a formatted dump with the memory contents formatted into one, two or three byte groups. In other words, if it encounters a CLR A instruction, only "\$4F" will be printed on that line. If it hits a JMP MIKBUG, it would print "7E E0D0" on one line, etc. It does not print the mnemonic value of the instructions.

"EN" outputs the standard end-of-tape code. This includes the contents of the program counter followed by an "59".

"FA" is a fastype mode. It generates a tape which may be used for input to an incompatible editor or BASIC Interpreter, etc. The carriage return is followed with a one-half second pause and all other control commands are eliminated from the data stream.

"FD" is the command you would use to boot a FLEX disk. "FI" is a short search routine which allows you to find one, two or three byte values. It prompts for the number of bytes you wish to search for, the value of those bytes and the FROM/TO pair which will tell the routine where to look.

"FM" allows you to fill memory. It prompts you for the area to fill with the standard FROM/TO prompt and prompts you for the value of the fill byte. One excellent use of this command is to fill all unused memory with SWI commands, "3 ". If you do this and your program bombs, the resulting register dump will tell you where it went astray.

"GO" will always jump to the address stored at \$A048. "GA" will print out the contents (address) stored at \$A048. It merely prints the program counter and shows you where the computer would start execution if you typed "GO."

"HD" will print a standard hexadecimal dump of memory between FROM and TO. The address appears at the beginning of each line followed by sixteen bytes.

"HE" stands for Help! It will print a summary of HUMBUG commands. It is only installed in the 2K versions.

"IQ" enables an interrupt routine so that the serial printer on port 0 can be used with interrupts to fill and print from a 1K buffer. This allows you to print and compute at the same time. It is available in the 4K version only.

"JU" is similar to the "J" command in SWTBUG. However, it uses a JSR instruction instead of a JMP instruction. This means that if there is an RTS at the end of the users program control will return to HUMBUG. It gives you an easy method of testing subroutines.

"LO" will load a tape on the control terminal. "MC" will compare the contents of two areas of memory. It prints out the memory contents for each byte that is different. It prompts you for the FROM/TO combination for the first memory area and the FROM address of the second. This particular command's output is one of the only HUMBUG formats I didn't like. It dumps its output continuously without the benefit of any carriage return/line feed pairs and is hard to read.

"ME" stands for memory examine and change and works exactly like SWTBUG's M command.

"MO" is the move memory command. The contents of memory in an area you name by answering the FROM/TO prompts is moved to another area. It should be noted that this routine even allows you to move data where part of the new area overlaps the original area. This is a feature you don't see too often.

"MT" is a simple rotating bit memory test. It checks the area within the FROM/TO area and prints a "+" sign if everything is ok. If there is a memory problem, it prints the address of the bad location and the contents of that location at the time the test failed.

"PU" is similar to SWTBUG's "P" command except that it prompts for the addresses you desire to punch.

"RE" which stands for register examine is a step ahead of SWTBUG's "R" also. The main improvement is in the format of the printing of the value of the CC register. HUMBUG prints it in binary which allows you to visualize which bits are set much easier. Also the printed stack pointer address tells you where the stack was pointing just before the breakpoint, rather than where it was pointing after returning to the monitor. It makes a whole lot of sense.

"SS" stands for single step. It prints the register contents after executing each instruction. It must however follow the "ST" or start single stepping command. "ST" prompts for the address where you want to start single stepping. "SS" prints out two lines. The first shows you the address and code of the instruction which you are checking. The second line is a register dump after the instruction has been executed. It is really a help for spotting logic errors in your code.

Other commands include "ZZ" which is a simple jump to \$C000, the address of Percom's DOS, and 30 or 12. The latter pair allows you to change your apparent baud rate by changing the initialization on the ACIA. If you change from a 16 times clock to a 64 times clock you will slow down your output baud rate by 4. I must be honest and say that this particular feature did not work for me when I tried it. I am sure it has something to do with the way I have my hardware configured but I just don't have the time to pursue it.

MEMORY REQUIREMENTS

The 2K versions only use the 128-byte scratchpad RAM at \$A000 on the MP-A or MP-A2 CPU cards. The 3K version requires that you have another scratchpad RAM at \$D000-\$D07F. The instruction manual shows you a very simple and inexpensive way to implement this additional memory.

The 4K versions require an additional 1K buffer at \$D400 for use as a buffer for the interrupt driven printer. Again, the users manual tells you how to set it all up. It even shows you how to convert an old 4K memory board for use at \$D400.

CONCLUSION

HUMBUG is one of the better monitors to come down the pike. The built in debugging utilities would have helped me a great deal several years ago when I was struggling to learn this business without the benefit of a disk system.

It is so well prompted that you could almost use it without reading the users manual. Once you know

the two letter codes you are home free.

The manual itself is attractively packaged and contains all the information you will ever need to exercise HUMBUG. The source code provided is extremely well commented and is an educational tool itself. I would highly recommend that anyone interested in talking to the 6800 right down at the gut level use this tool to speed them up the learning curve. I only wish it had been available three years ago.

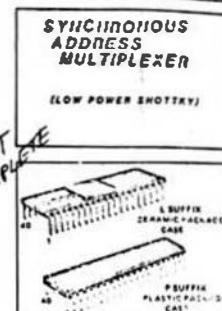

Note: The problem mentioned above under the Command 'LO' is apparent only on narrow CRT lines (32 or 64 characters per line). CRT displays that exhibit 80 characters per line do honor the CR/LF and are more readable.

MC6883

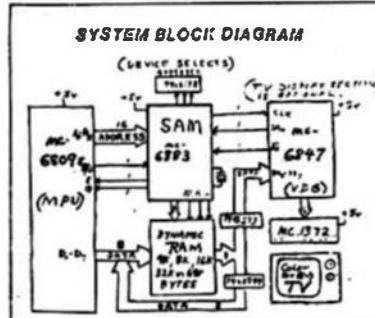

The Motorola MC6883 is the 'heart' of the Radio Shack TRS80C™ Color Computer, that is being delivered now. It is a new device and little has been published on it so far. It uses a 6809E and other Motorola devices - unfortunately no S50 bus. The following technical data is presented due to the large amount of interest indicated by the letters and calls we have received. This is poorly reproduced; we could do no better. We run it hoping that with a little guessing and magnifying glass operation you may garner some interesting facts and values. We trust that this machine will allow the beginning user to realize what a fine device the 6809 is; and then upgrade to a 'real' 6809 computer - just like yours and mine!

MC 6883
(74LS783)

Advanced Information	
The Motorola MC6883 brings together the MC6809E (MPU), the MC6877 (Color Video Display Generator) and Dynamic RAM to form a highly effective, compact and cost effective computer and display system.	
• MC6809E and MC6883 (VDC) compatible	DATASHEET NOT COMPLETE
• Transparent MPU/VDC/Refresh	
• RAM sizes: 4K, 8K, 16K, 32K or 64K bytes (dynamic or static)	
• Addressing range: 36K bytes	
• Single crystal provides all timing	
• Register programmable:	
• VDC addressing modes	
• VDC offset (0 to 64K)	
• RAM size	
• Bank switch	
• MPU rate (crystal +16 or +8)	
• MPU rate...address dependent or independent	
• System device selects "decoded on chip"	
• Timing is optimized for standard RAMs	
• +5V only operation	
• Easy synchronization of multiple SAM systems	
• DMA mode

ELECTRICAL CHARACTERISTICS (Unless otherwise noted specifications apply over recommended power supply and temperature range)

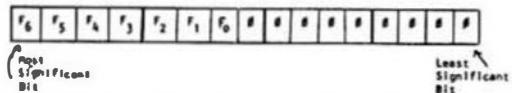

Characteristic	Symbol	Min	Typ	Max	Units
Power Supply Current	I _{SS}	-	100	220	mA
Output Short-Circuit Current	I _{SS}	20	-	225	mA

$1C = 64 \times 64$
 $2C = 128 \times 64$
 $3C = 128, 96$
 $6C = 128, 192$
 $6R = 256, 192$

VCO ADDRESS OFFSET

Seven bits ($r_6, r_5, r_4, r_3, r_2, r_1, r_0$) determine the "STARTING ADDRESS" for the video display. The "Starting Address" is defined as "the address corresponding to data displayed in the upper left corner of the T.V. screen". Thus, the "Starting Address" is shown below in binary:

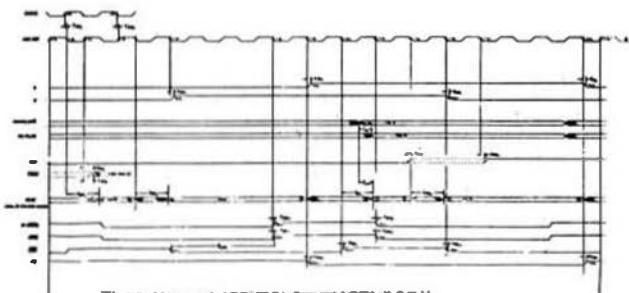

Note that the "Starting Address" may be placed anywhere within the 64K address space with a resolution of 1K (the size of one alphanumeric page).

The $r_{0,1}$ bits take effect during the T.V. vertical synchronization pulse (i.e., when V_{DD} from MC6807 is low).

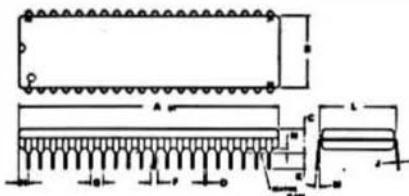

PAGE SWITCH

One bit (p_1) is used in place of p_1 A15 from the 6809 in order to refer access within \$0000-\$FFFF to one of two 32K byte pages of RAM. If the system does not use more than 32K bytes, p_1 can be ignored.

When using 4K x 1 RAMs, two banks of eight IC's are allowed. This accounts for Addresses \$0000-\$FFFF. Also, this same RAM can be addressed at \$2000-\$3FFF, \$1000-\$5FFF and \$6000-\$7FFF.

<http://www.sciencedirect.com/science/journal/00406034>

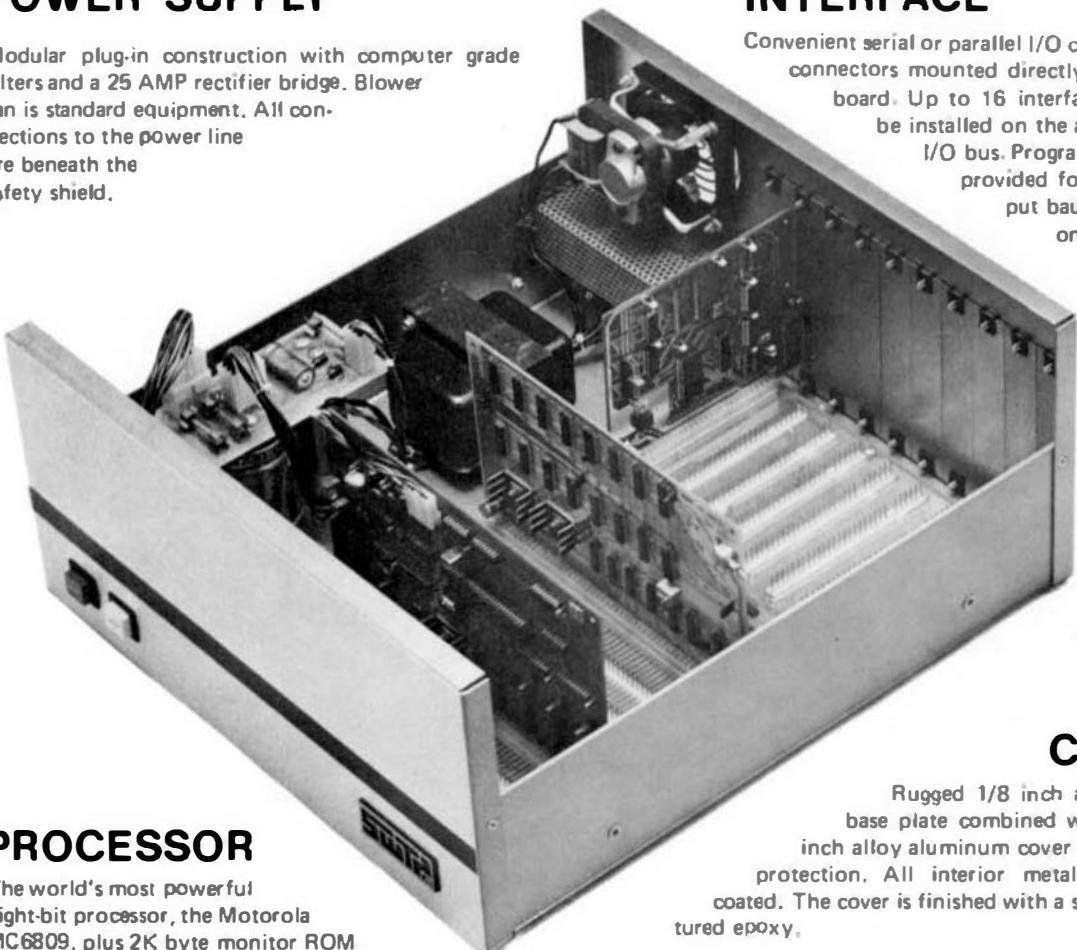

NOTE: When using TDS 20M units as an input, the analog feed or the 12 channels within the 20M channel or the 20M channel (unless the synchronization source is external) The synchronization source is required at minimum of 20 msec. of support for operation.

 MOTOROLA SEMICONDUCTOR PRODUCTS INC.

WE HAVE A 6809 FOR YOU

POWER SUPPLY

Modular plug-in construction with computer grade filters and a 25 AMP rectifier bridge. Blower fan is standard equipment. All connections to the power line are beneath the safety shield.

PROCESSOR

The world's most powerful eight-bit processor, the Motorola MC6809, plus 2K byte monitor ROM that is 2716 EPROM compatible and full buffering on all output lines. Built-in multiuser capability, just add I/O cards to operate a multi-terminal system.

MEMORY— You can purchase the computer with either 8K bytes of RAM memory (expandable to 56K), or with the full 56K. The efficient, cool running dynamic memory used in this system is designed and manufactured for us by "Motorola Memory Systems Inc."

PERIPHERALS— The wide range of peripheral hardware that is supported by the 6809 includes: dot matrix printers (both 80 and 132 column), IBM Electronic 50 typewriter, daisy wheel printers, 5-inch floppy disk system, 8-inch floppy disk systems and a 16 megabyte hard disk.

SOFTWARE— The amount of software support available for the 6809 is incredible when you consider that it was first introduced in June, 1979. In addition to the FLEX9 operating system, we have a Text Editor, Mnemonic Assembler, Debug, Sort-Merge, BASIC, Extended BASIC, MultiUser BASIC, FORTRAN, PASCAL and PILOT.

69/K Computer Kit with 8K bytes of memory	\$ 495.00
69/A Assembled Computer with 8K bytes of memory	\$ 595.00
69/56 Assembled Computer with 56K bytes of memory.....	\$1,595.00

INTERFACE

Convenient serial or parallel I/O cards have DB-25 connectors mounted directly on the circuit board. Up to 16 interface devices may be installed on the address decoded I/O bus. Programming strips are provided for input and output baud rate selection on each port. All outputs are fully buffered.

CABINET

Rugged 1/8 inch alloy aluminum base plate combined with a solid 1/8 inch alloy aluminum cover for unsurpassed protection. All interior metal is conversion coated. The cover is finished with a super tough textured epoxy.

6809 DISK SYSTEMS

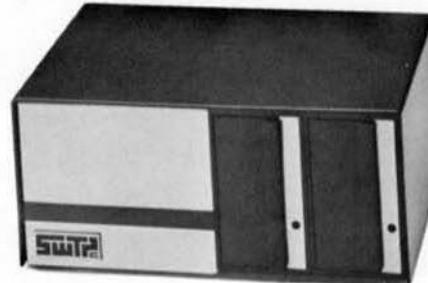

All disk systems are supplied with our version of FLEX 9, the world standard disk operating system for the 6809. Our systems normally operate in double density format, but they are compatible with single density, or single sided recording formats. FLEX is supplied with over forty utilities, many of which are only available with our systems.

Our disk systems offer you mass storage at low cost. The cost per thousand bytes of storage for our various systems is shown in the chart. Other 6809 disk systems have costs up to three times greater for the same general type drive.

TYPE	CAPACITY	COST
D-5	720,000 bytes	\$1.80 per/K
DT-5	1,400,000 bytes	\$1.16 per/K
DMF-2	2,400,000 bytes	\$1.04 per/K
CDS-1	16,000,000 bytes	\$.27 per/K

D-5 Two double sided, double density, 5" disk drives with a total on line capacity of 720,000 bytes of data. Includes cabinet, power supply, connecting cable and controller. Controller will operate up to four drives. This is an ideal disk system for small stand alone word processing systems, or for businesses that do not work with large inventories.

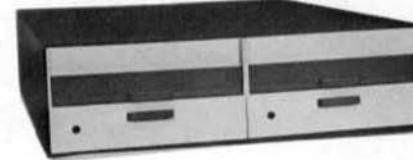

14 x 6 x 10 - 20 lbs\$1,295.00

D-5 or DT-5

DT-5 Double track density version of the D-5. The DT-5 uses two 96 track per inch drives to provide an on line capacity of 1,400,000 bytes. Includes cabinet, power supply, connecting cable and controller. Controller will operate up to four drives. This is a disk system with enough capacity to include small inventories of up to 1,000 items, plus the usual business package of general ledger payroll, etc.

14 x 6 x 10 - 20 lbs\$1,695.00

DMF-2

DMF-2 Double sided, double density, dual eight-inch disk system with an on line capacity of 2,400,000 bytes. Our "top of the line" disk system features a DMA type controller for fastest possible data transfers. This drive was designed for larger businesses and multi user installations. The DMF-2 will provide the fast operation necessary for systems running multiterminals under the UniFLEX operating system. Complete with a heavy duty 1/8-inch metal cabinet, power supply, connecting cable and controller. The controller will operate up to four drives.

17½ x 5 x 21½ - 53 lbs\$2,495.00

CDS-1

CDS-1 This "Winchester" type hard disk provides both large storage capacity and high speed operation. The CDS-1 is the answer for systems that must handle large inventories or systems with more than four terminals. The controller has its own processor and uses DMA data transfer.

CDS-1 - 115 lbs\$4,395.00

S.A.M. (SYNCHRONOUS ADDRESS MUXPLIERT)

PROGRAMMING GUIDE

S.A.M. - GENERAL DESCRIPTION

The S.A.M. is a 40 pin integrated circuit to be used with the MC6809 Microprocessor Unit (MPU), the MC6847 Color Video Display Generator (VDE) and up to 64K bytes of dynamic RAM.

As the name implies, the S.A.M. multiplexes the MC6809 addresses and the MC6847 addresses into eight dynamic RAM address pins. In addition, the S.A.M. provides complete system address decoding and timing (including A₁₅, E₁₅ and V_H). The S.A.M. provides clocks to the MC6809, MC6847 and the internal refresh counter in such a manner as to SYNCINIZE all three.

S.A.M. - PROGRAMMABILITY

The S.A.M. contains a 16 bit control register which allows the 6809 to program the S.A.M. for the following options:

VDC ADDRESSING MODE	= 3 bits
VDC ADDRESS OFFSET	= 7 bits
I/O PAGE SWITCH	----- 1 bit
MPU RATE	----- 2 bits
MEMORY SIZE	----- 2 bits
MAP TYPE	----- 1 bit

Note that when the S.A.M. is reset by first applying power or by manual hardware reset, all control register bits are cleared (to a logic "0").

VDC ADDRESSING MODE

Three bits (V_1 , V_2 , V_3) control the sequence of DISPLAY ADDRESSES generated by the S.A.M. switch are used to scan dynamic RAM for video information. For example, if you wish to display Dynamic RAM data as INTERNAL ALPHANUMERIC VIDEO, you should program MC6847 for the INTERNAL ALPHANUMERIC MODE and CLEAR BITS V_1 , V_2 and V_3 in the S.A.M. The table on the following page summarizes the available modes:

In a "SAM computer", a PIA at location \$FF22 is used to control MC6847 modes. (See MC6847 Data Sheet.)

MPU RATE

Two bits (A_1 , A_0) control the clock rate to the MC6809 MPU. The options are:

RATE (FREQUENCY OF "I" CLOCK)	A_1	A_0
0.9 MHZ (CRYSTAL FREQUENCY = 16)	0	0
0.3/1.6 MHZ (ADDRESS DEPENDENT RATE)	0	1
1.8 MHZ (CRYSTAL FREQUENCY = 8)	1	X

(Typical Crystal Frequency = 16.31012 Hz)

In the "Address dependent rate" mode, accesses to \$0000-\$FFFF and \$7FFF-\$FFFF are slowed to 0.3 MHZ and all other addresses are accessed at 1.8 MHZ.

MEMORY SIZE

Two bits (M_1 and M_0) determine RAM memory size. The options are:

SIZE	M_1	M_0
One or two banks of 4K x 1 dynamic RAMS	0	0
One or two banks of 16K x 1 dynamic RAMS	0	1
One bank of 64K x 1 dynamic RAMS	1	0
Up to 64K static RAMS	1	1

IMPORTANT

** Be sure to program the S.A.M. for the correct memory size before using RAM (i.e., for a subroutine block).

MAP TYPE

One bit (TY) is used to select between two memory map configurations.

The options are:

TYPE	T_0
RAM: \$0000-\$FFFF	0
ROM: \$0000-\$FFFF	1
I/O: VECTORS, SAM CONTROL REG.: \$FF00-\$FFFF	

RAM: \$0000-\$FFFF
I/O, VECTORS, ROM, SAM CONTROL REG.: \$FF00-\$FFFF

* Refer to Appendices A and B.

** Requires an extra latch for demultiplexing the RAM address.

WRITING TO THE S.A.M. CONTROL REGISTER

Any bit in the control register (C.R.) may be set by writing to a specific unique address. Each bit has one unique address...writing to the n th bit address allows the MPU and writing to the m th bit address sets the bit. (There are no data bus to treatment in this procedure.) The unique addresses are tabulated in Appendix A and Appendix B.

If desired, a short routine may be written to program the S.A.M. C.R. "in word at a time". For example, the following routine copies "n" bits from "A" register to S.A.M. C.R. addresses beginning with address "R".

SAM1	R6	R00 A	7 6 5 4 3 2 1 0	15
	26	06 DEC 000

RMS dbms

Larry Kheriaty, Washington Computer Services

DBMS: WHAT AND WHY?

Everybody knows that computers can be programmed in BASIC or PASCAL or whatever to do all sorts of record keeping functions cheap. Right...? Wrong! We all watch in delight as computer power increases, and computer prices decrease. But, even though the hardware is ready for business, the software is not. The reason is simply that software is a labor-intensive product. And to make matters worse, the software laborer must be highly skilled, (and highly paid). Even the most efficient programmer is forced to wade through a forest of messy details just to get to the point where he can attack the particular problem at hand. Many a business system has been developed by brute force only to find that to alter it for day-to-day changes in the real world, or to modify it to fit another business, can be accomplished only by investing further amounts of costly programmer time. The solution to this problem lies in the application of the right software tools. RMS, a database management system, is such a tool.

The theory behind database management is that there is a fairly broad class of record keeping problems which all share certain common aspects. These common aspects are handled in a general way. Thus, when attacking a particular data handling problem, many of the tedious programming tasks that would otherwise need to be done just to get off the ground, are taken care of automatically by the DBMS. The common aspects of any computerized record keeping system are: 1) putting individual pieces of information into the database; 2) modifying the information in the database; 3) fetching information from the database on command; 4) re-arranging the information in the database, and, 5) producing printed reports from the database. As you know, all of these things can be accomplished by writing some programs to manipulate files. However, a set of such programs is NOT a database management system. With a database management system it is possible to perform all of these tasks without ever writing any programs. The user need only describe the data items that are to be managed; the DBMS takes care of the details. Record Management System (RMS) is a set of extremely efficient 6809 machine language programs that make up a versatile and understandable DBMS.

THE DATA DICTIONARY

To establish a database using RMS, the first step is to create a text file called a DICTIONARY. The dictionary is a description of the type(s) of RECORDS to be stored in the database. A record is a collection of FIELDS. Each field contains a particular data value. For example, a record might contain 4 fields: name, social security number, rate of pay and number of tax exemptions. Within the dictionary each field is given a name, a data type code and a length. Also included for each field is a prompt string. The prompt string is a descriptive message which will be used by RMS when displaying the record as a form on the CRT screen. Optionally, the dictionary may include restrictions on the values which are to be allowed in a field. For example, a field which is to contain a grade from a class might be restricted to values of A,B,C,D or F. The type code of the field also determines the particular data values that can be stored. The RMS field types are A(iphilphanumeric), N(umeric), M(oney) and D(date).

To sum up the function of the dictionary file; it tells what fields are to be stored in each record of the database, it tells what type of data each field may store, it tells what values are allowed in each field, and it determines what the record will look like when displayed as a form to be filled out on the CRT screen. RMS allows a database in which every record has the same format; or a database with two types of records. In this case there are primary records (which all have the same format), and each primary record may own any number of secondary records. The format of the secondary records is different from that of the primary records. An example of this organization is a database with a primary record for each customer, with a secondary record for each of the customer's invoices.

The dictionary may be entered with any text editor as a text file with the suffix ".DIC".

INITIALIZING AN RMS DATABASE

Once the dictionary file is entered on disk, the RMSNEW program is used to create an "empty" database file with the appropriate characteristics. The user need only supply the maximum length record, and the maximum number of records to be stored in the database. The database file itself will be in standard text file format with fixed length records. Thus it is easy to access the database directly from user written BASIC, PASCAL, etc. programs. RMS itself uses "hash coding" to locate individual records in the file. Hash coding is simply a formulaic method of scattering the data records all over the file in such a manner as to allow extremely rapid access to any particular record if its key is known. The hash coding formula is explained and given as a BASIC subroutine in the RMS manual.

GETTING RECORDS IN AND OUT

The RMS record editor allows the operator to use the CRT screen as a window to the database. The screen will contain a form fill-out type of display that represents a record from the database. The user can add, change or delete records, look up information by record key, or browse through the file in random order or a specified order. RMS will insure that all data entered is valid for the type of field and for any restrictions placed on the field by the dictionary. This program serves the purpose of data entry, data validation, and online database access. RMS can look up any record in the database instantly and display it in the form on the screen. The form is made up of the prompt strings found in the data dictionary so it can look exactly as the implementor specifies. The cursor will come to rest only in places on the screen where the operator should type. It will not allow invalid data to be entered. The operator uses special function keys to move from field to field, enter data and cause records to be read or written to disk. As supplied RMS is configured for the SwTPC CT-82. However it is easy to re-configure it for most other types of CRT terminals.

GETTING PRINTED REPORTS

RMS includes a report writer facility. To use it you need only create a text file called a REPORT SPEC. The report spec is a few simple lines which tell what records from the file are to be printed, in what order they are to appear, and what the exact format of the printed output is to be. In general, the user will create many different report specs for the database. Each report spec will describe one of the printed reports to be produced on command. The following functions may be selected in any combination when creating a report spec: report title page; report wrap-up page; process records in any order; adjust to any page size; skip page

perforations; include or exclude records as determined by field values; page headers; complete control over print format including the ability to print any number of lines per record; field totaling and sub-totaling; record counting; system date and page numbering; control breaks; and record group-end summaries.

SORTING AND INDEXING

RMS also includes an indexing utility which can be used to create an index on any field within the records. This index can be used to drive the RMS record editor or the report writer. This gives the user complete control over the order of record processing. The Index utility is essentially an efficient sort/merge which produces an ordered list of record keys. The output is in text file format so indexes can be accessed or even created by user-written BASIC programs.

REORGANIZING THE DATABASE

The RMSCOPY utility is used to move the contents of one database file to another. It can perform one or more of the following functions in the process: merge two database files; post a transaction database to master database; expand or contract a file; or change the field and/or record layout of a file. This means that if, after the database is in use, new fields need to be added to the file, it can be done by a simple dictionary change and RMSCOPY.

WHO CAN USE DBMS

Anyone who has a record-keeping function, be it accounting, customer lists, inventory, client control, student records or whatever, should consider the database management approach. It will normally be the most efficient route to a working system. And it will produce a system which can change to keep up with changing requirements. With RMS even the relative novice can implement a sophisticated database management system that is custom tailored to his specific needs. The experienced programmer can use RMS to leap far ahead in system implementation, skipping over many hours of unnecessary programming to do the common tasks that every system needs. His time can be spent directly on the programs that perform the unique processing of the particular system.

RMS is available for a 6809 Flex-based system from Washington Computer Services, 3028 Silvern Lane, Bellingham WA 98225. It is also available from Southwest Technical Products Corporation.

STUDENT Grade

'JW' stands for 'John Wood', the founder of Quincy, IL, and the namesake of one of the most innovative Community Colleges in America. 'JWCC' (as it is known) has teamed up with Harris Corp., one of the world's leading manufacturers of broadcast equipment, to provide a 2 year Associate Degree program in Broadcast Engineering Technology.

Students take support courses such as Math and English at local colleges, but the core courses are taught inside the Harris plant, where they have access to the same state of the art equipment (such as Spectrum Analyzers, Logic Analyzers, etc., as is used on the 'front line').

The Harris Instructional Staff never get behind

the state of the art, as does happen in conventional Tech Schools, because they are continuously learning new products to teach to domestic and international students on a continuing basis.

This series of programs, written in TSC's XBasic on a SWTPC 69A with 40 K of memory, was designed to take the drudgery out of keeping up with the grades for the John Wood students. With this series of programs a class roster can be created, and then added to or otherwise edited. After every editing job, the file is sorted in alphabetical order. The SCORE program grades a multiple-choice test. It calls the roster for the class, asks you whether the student was present or absent, the questions missed, and for a personal code number known only to the student. (It is illegal to post grades by name or even by Social Security #, but grades can be posted by a personal code)

The SCORE program then analyzes each test item, and tells you what percentage of the class got it correctly. They are then categorized as 'simple', 'easy', 'moderate', 'hard', or 'difficult'. The printout lets you scan the results for suggested placement of items in the future. It has been shown that it is best to start out with easy questions and work up to hard ones.

The test grades are listed in three categories: 'raw', which is the actual grade, 'percentile', which is the 'normalizing' procedure to rank a student as to where he stands in relation to the mythical 'average' on ye olde bell-shaped-curve (the top of the curve=50), and the final classification is 'adjusted' which just shifts the bell curve upwards to where the top of the curve is at 75. (Students don't like to be called '50', but '75' they can live with.)

The POST program tabulates any previously given test in any form you may want it for posting. Sorted by grade, by name, by SS#, by 'code' number, by percentile, etc.

The ISSUE program prints out a mailing list from the CLASS program, pulls the grades for each student, and gives a status report that can be mailed to each student.

The program is still in the works and is by no means complete but this is what I have so far. I keep an 'item' file on each test question I give, and a record of its past performance.

I plan to put each item on a disk file, and each time a test is graded, the results will be added to the file. In the future I will be able to pick out which items I want and have the computer print me out a test. In fact, I will be able to specify a class average and have the computer pick my items that are most likely to give me that average. (If the class gets too cocky, for instance, and think they are hot-shots... I can always pull them down a peg or two.)

If you need any help with the administration of testing and record-keeping at your school via computer, I am only a phone-call away.
Testing and record-keeping at your school via computer, I am only a phone-call away.

Re: Motorola 6809 manual, on this count you rate 100..the manual stinks (compared to past publications). The price of the 6809 seems reasonable and on the software you are off. There is more useful applications software for the 6809 than any other chip in its class. The variety is not as great but the 'quality' is there...note products advertised in these pages. I do not know of any 80XX software that will begin to compare to Microware's OS-9 or TSC's Uniflex". And these are only a beginning!!

Again Pete I appreciate your thoughts, not even all of us who are exclusive 68XX, S50 agree among ourselves. But the one thing that has kept us a viable and GROWING group has not been the 68XX as much as it has been the S50 bus. After all who enjoys their ice cream with mustard and horseradish?

DMW

FULL SCREEN DISPLAYS DR. E. M. PASS

The programming systems for micro computers currently provide more than primitive support for full screen (two dimensional) display and input. This is important, since two-dimensional displays can greatly simplify controls and improve the man-machine interface in many cases. This article attempts to define the problem and offer some solutions.

Consider the display and input requirements of a simple mailing list system. For each record on the file there are approximately ten data fields. Each record is uniquely identified by a key which is arbitrarily assigned or is based upon some of the data fields in that record. A one-dimensional approach to updating an existing entry on the file would involve an interactive process of asking if each field to be turned requires modification, then requesting input for the selected field. Another one-dimensional approach would require the entry of the entire record ("HARD") before a field to be updated. A two-dimensional approach to the problem would involve the use of a formatted screen. All ten fields would be displayed and updates could be keyed over the fields to be changed. This is far better than human engineering than in the one-dimensional case.

There are several alternative hardware approaches to the problem of two-dimensional I/O, which may be summarized as follows:

1. ignore the problem,
2. use memory mapped video displays and keyboard inputs,
3. use "dumb" or "intelligent" terminals which support formatted screens,
4. use "dumb" terminals with cursor control capabilities.

It may also be preferable in those cases in which the benefits of two-dimensional display do not outweigh the additional programming time and effort usually required compared to one-dimensional display and input.

The use of the memory mapped video displays is increasing. Most of the "Appliance" micro computers (such as TRS 80, APPLE II, PET, TI, etc.) use this technique. Because the display represents the contents of an area of directly addressable memory, changes to the screen may be made very quickly. Since the micro processor has better control over this type of display, special effects, such as multiple cursors, multiple independent subscreens, graphics, colors, blinking, multiple intensity levels, protected fields, etc. are simpler to implement on displays. For two-dimensional display purposes memory mapped video displays are generally superior to terminals, and may be less expensive in many cases.

"Smart" or "intelligent" terminals which support formatted screens are used quite heavily on mainframe systems. Until recently, the cost of these terminals was prohibitive for micro computer systems. There exists very little support in micro computer programming systems for the specialized data formats required by many of these terminals for proper operations. The screen formatting capabilities of many of these terminals are being ignored for these reasons, and they are being used as "dumb" terminals.

Most of the one "appliance" terminals are connected to terminals, *i.e.* via serial interface, master controlled cursor control, and screen clear, and full duplex (non menu) mode. Along with these terminal functions, other special programs for these terminals can be used to support two-dimensional displays. As with "smart" terminals, the control functions are almost always performed with intended characters in the data stream. Full duplex operation is required so that the computer can control the display protocols.

The primary problem impacting increase use of full screen displays on micro computers seems to be lack of programming support. Let us analyze the problem of generating and controlling any two-dimensional display, i.e. a high-level language independent of hardware display:

```
submit: only input,
programmable INPUT (protected),
intensity,
reverse display,
blinking,
colors,
underlining,
etc.
```

In both one and two dimensional cases, the minimum type of a given display must be considered.

Considering the two dimensional display as a grid of fields (each defined by its position, content and attributes), provides a basic structure which allows the definition of a high level programming aid. This aid can hopefully be best implemented as a set of subroutines under an existing programming system. Using this technique, fields can be defined in a table. Then the subroutine can use the table, and, using lower level device handlers and primitive functions specific to the display hardware, can control the display and input protocol. Care for feature selection in the field attributes and maximum byte dimensions of the display, the construction of the field table is independent of the display hardware. The input and output protocols are also independent of the hardware dependency, but can be set up in an initialization routine.

You can then take various routines for the display which can be used to provide the formats for the inputs, i.e., no move to the display, input is aligned to any field, any direction, numeric only fields are stored in words, no input is restricted to the eight, plus, minus, comma, and period. The data input to a field replaces the previous data in the display and is read field table, a cursor usually designates the position on the display which will be modified if a displayable character is struck on the keyboard. Input into a protected or undefined field is not allowed. The cursor is normally initially positioned to the beginning of the first unprotected field on the display. If the current characters on the display is set to be modified, one of the following special functions may be selected:

```
cursor right,
cursor left,
```

```
next field,
previous field,
current field,
restore cursor field,
first field,
arrow to end of field,
insert character,
delete character,
transmit.
```

On many terminals, some or all of these functions may require the simultaneous depression of two keys. Once a field is completed, a common field level edit subroutine is called to allow deletion, interactive editing of each fields at once, delete/insert data, pause numbers, social security numbers, zip codes, etc.

The device handlers perform the low level hardware dependent functions necessary to support the higher level display and input functions. For many mapped displays, the device handles store or retrieve data to or from the display memory, possible after synchronization with horizontal and vertical reference signals. For all types of displays, the device handlers perform the elementary input (without edit) and output operations. Because of the large number of characters on the screen modified in many cases, there will usually be a perceptible screen update time. This can be minimized for serial terminals by setting the transfer rate on KSP as fast as possible.

The primitive functions use the device handlers to perform specific, elementary functions which are also hardware dependent. The following list of functions is normally performed at this level:

```
set display attributes,
reset display attributes,
output string of characters,
input one character,
clear screen,
sound alarm,
cursor left N positions,
cursor right N positions,
cursor up N positions,
cursor down N positions,
move cursor to (column, row).
```

Perticular hardware requirements may lengthen this list.

The high level subroutines (screen display and screen input) are defined. They use the field tables, primitive functions, and program logic to accomplish their respective tasks. In order that a given program might have more than one screen format defined, the high level subroutines process only those fields with screen number within an externally defined range. In a data entry application, the protected fields could be defined for a different screen number from the unprotected fields. Then the protected fields would be displayed only once and would remain on the screen, even after the unprotected fields have been reset. Other switches provide for automatic reading of unprotected fields before input, automatic skipping to next field, and input only (error correction) operations.

Since the order of entry into the fields on the screen is controlled by the order of the corresponding field table entries, columnar or non sequential order of input is simple to implement. On virtually all "smart" terminals, the order is left to right, top to bottom. The field level edit capability of the input subroutines also allows for instant price extensions, conditional protecting and unprotecting of fields, and other high interactive features present in only the most "intelligent" terminals.

The operations of the high level screen display function may be summarized (in a pseudo language) as follows:

```
loop: loc1
    IF NO MORE FIELDS, GO TO EXIT
    IF SCREEN (1) OUT OF RANGE, GO TO LOOP
    GET FIELD (1) CONTENTS FROM TABLE
    IF (CLASS ALL UNPROTECTED OR (CLEAR FIELD BEFORE DISPLAY) AND UNPROTECTED, CLEAR
        FIELD (1) CONTENTS
    IF REQUESTED FOR FIELD (1), CLEAR SCREEN
    SET FIELD (1) ATTRIBUTES
    SET CURSOR (COLUMN (1), ROW (1))
    TRANSLATE FIELD (1) CONTENTS TO DISPLAY
    RESET FIELD ATTRIBUTES FOR FIELD (1)
    GO TO LOOP
    EXIT: RETURN
```

The operations of the high level screen input function may be summarized (in a pseudo language) as follows:

```
CALL SCREEN DISPLAY FUNCTION
RESET:--1
DIRECTION:--1
LOOP: 1-1-SELECT10N
    IF 1 IS NEGATIVE, GO TO RESET
    IF NO MORE FIELDS, DIRECTION:--1, GO TO LOOP
    IF SCREEN (1) OUT OF RANGE, GO TO LOOP
    IF FIELD (1) PROTECTED, GO TO LOOP
    GET FIELD (1) CONTENTS FROM TABLE
    SET FIELD (1) ATTRIBUTES
    SET CURSOR TO (COLUMN (1), ROW (1))
    EXIT: RETURN
```

```
INPUT: INPUT A CHARACTER
    IF CHARACTER NOT CONTROL, GO TO MOVE1
    IF END OF FIELD INPUT, GO TO MOVE1
    PROCESS CURSOR LEFT, CURRENT FIELD, NEXT FIELD, FIRST FIELD, PREVIOUS FIELD,
        RESTORE CURRENT FIELD INPUT SEQUENCE
    IF AT END OF FIELD, SOUND ALARM, GO TO INPUT
    PROCESS CURSOR RIGHT, ZONE TO END OF FIELD, ERASE CHARACTER, DELETE CHARACTER
    INPUT REQUESTS
    IF KEYWORD CONTROL CHARACTER, SOUND ALARM, GO TO INPUT
    IF AT END OF FIELD, ZONE TO END OF FIELD, GO TO INPUT
    IF MULTIPLE INPUT REQUESTS FOR FIELD (1), IF INPUT CHARACTER NOT NUMERIC OR PLUS
        OR MINUS OR PERIOD SOUND ALARM, GO TO INPUT
    REPLACE FIELD (1) CHARACTER WITH INPUT CHARACTER
    ERASE FIELD POINTER
    IF NOT BEYOND END-OF-FIELD OR NOT AUTOREP, GO TO LOOP ELSE CHARACTER=GET-FIELD
    INPUT FIELD TABLE FOR FIELD (1) CONTENTS
    CALL FIELD EDITOR
    IF ERASE RETURN, SOUND ALARM, RESET TO FIELD, GO TO INPUT
    IF NEXT RETURN, DIRECTION:--1, GO TO LOOP
    IF PREVIOUS FIELD, DIRECTION:--1, GO TO LOOP
    IF HOME CURSOR, GO TO RESET
    EXIT: RETURN
```

Note that "dumb" & "intelligent" terminals are treated as almost "dumb" terminals by these subroutines. Alternative formulations are possible in specific cases which make better use of particular terminal characteristics, but also limit the generality of the subroutines.

Once programming support for full screen display and input (in the form of high level subroutines, properly interfaced) has been developed, many types of application areas become much simpler to implement and to use. These include the following major areas:

data, 48K BYT,
graphics,
word processing,
text processing,
data base entry and update,
specialized applications,
games,
etc.

This article has attempted to present a programming methodology for attacking and simplifying the problem of full screen (two dimensional) display and input on micro computers. The method involves a high level, table driven, hardware independent, set of subroutines supported by lower level, hardware dependent, primitive functions and device handles.

P. O. Box 649.
Knoxville, Tennessee 37346.

Dear Sir:

This morning I dropped into one of the local Radio Shack stores and plucked up a copy of the new TRS-80 Computer Catalog. I'd read rumors in '68' Micro Journal and other mags about Radio Shack going to the Z80 or not going to the 8009, and I was interested in seeing what they'd done. The TRS-80 Color Computer and TRS-80 Videotex smart terminal use a 6809 and a 6847; the other TRS-80 models still use the Z-80. The TRS-80 Color Computer appears to be Radio Shack's reply to the Atari, AMF and Texas Instruments home computers. The TRS-80 Videotex terminal also comes with an hour on the Computerwave timesharing system included. Neither machine has shown up in Knoxville yet, but the specifications look good.

The TRS-80 Color Computer is built around the 6809 microprocessor and the 6847 video display generator. It comes with either 8K or 16K of dynamic memory and either 8K BASIC or 16K BASIC in ROM. Also available are a number of program discs of machine language programs in ROM: a color receiver, printer, cassette recorder, telephone modem and joysticks. A disk system may be available soon. Built-in TRS-80 Color Computer hardware also includes a real time clock and RS-232 serial interface. The currently available program discs include Personal Finance, Game Commander, Football, Checkers, Custer, Music, Bingo Bath, Pinball, and a diagnostic ROM.

The 8K Color BASIC has strings, 8 place floating point arithmetic, ABS, INT, AND, SIN, COS, SQR, PIEN, POKE, USER, INPUT (read joysticks), SET (select color) and SOUND (music through the TV speaker). The 16K BASIC has in addition TIME\$ (read real time clock), PRINT\$ (print in dollars and cents format), stronger graphics capability, program editing functions, better error messages, user defined key, and string arrays. The graphics commands compare favorably with the Apple II's routines and include size changes of the displayed shapes, line drawing functions, shape rotation, shape movement, circle drawing function, rectangle drawing function, plus save and load graphic shapes.

The TRS-80 Videotex is a terminal version of the TRS-80 Color Computer and, judging from the catalog illustrations, has graphics capability, it comes with 4K RAM buffer, Videotex smart terminal software (also available for the Color Computer, other TRS-80 models, and the Apple II), and a direct connect modem. The best feature is a free hour on the Computerwave timesharing network. Radio Shack plans to, or has established its own bulletin service on Computerwave. It appears that electronic mail is coming closer and closer.

None of this hardware has appeared in Knoxville yet. Probably we won't see a lot of it until the Christmas shopping season is over. Once we see the stuff for real, we can have a much better idea about what's what.

Very truly yours,
Bill Beckwith
William H. Beckwith

Dear friends:

After the introduction of the MC6809, having read some of the documentation on this subject, it didn't take much time to make me enthusiastic about this powerful processor. As an owner of an ITT 2824 personal computer

(the European second source for the APPLE II) soon the idea arose to expand my computer with the power of the 6809. Others have already done the same with a Z80 CPU. I am still brainstorming and I have probably not overlooked all the possibilities and/or problems. I would be glad with all the help I can get. At the same time I hope that my letter stimulates many hobbyists and professionals. If you have any suggestions or ideas, please send them to:

STAR-KITS

P.O. Box 398
MT REED, NEW YORK 10549

URGENT RELEASE

The lowest-cost single-board computer system yet has just been introduced by Star-Kits, P.O. Box 398, Mt. Reed, NY 10549. The Model BBC-02 computer is a minimal 4-chip system on a 6"x6" printed circuit board, which features a 6802 processor with 128 bytes of RAM, 2K of ROM, and parallel or serial I/O. A wide-wrap area is provided for custom interfacing or other expansion. Because of its low cost, the BBC-02 is ideal for system development, limited-run production, and school or company training programs.

In simple quantities, the computer costs \$25 for a bare board with instructions, \$75 for a parallel I/O kit, or \$150 when wired and tested. Optionally, a machine level monitor called BURBON can be installed to provide program entry and control, single-stepping, breakpoints, and other front-panel functions from a serial terminal. BURBON runs on the 4-chip system, and is supplied separately in 2716 EPROM for \$40 (included at no charge in the kit and w/16 versions.)

Additional support includes extensive tutorial literature, 68 floating point math in ROM which runs on the system, a cross-assembler for 6802 program development, BURBON ROM for other 6800 systems, and consulting services.

P.O. Box 649
Knoxville, TN 37346

Sometime I hope to own a "daisy wheel" printer and your servicing experience was of much interest to me.

Right now I am using a Teletype Model 43. You may be interested in the "problem" I had when I needed some work to be done on it. The machine "went dead" on a Thursday evening. Friday morning I called the service branch in Pittsburgh and was told to bring the unit in at my convenience, which I did later the same day. When I left it they were almost apologetic in saying that they doubted it would be ready before the following Monday morning. Early Monday morning I received a call telling me that it was ready. Repairs consisted of a limit switch plus cleaning and oiling cost me \$54, billed later.

In the future, whenever I buy major new gear, adequate servicing facilities will be high on my list of priorities.

New Product Release: SIM80

LSI Enterprises is pleased to announce its newest product, SIM80. SIM80 is an 8080/8085 simulator that executes 8080 machine language programs directly without modifications. It is an "interpreter" written in 6809 and 6800 machine code. It is approximately 2 - 10 times slower than an 8080 running at similar clock speeds. It executes all of the 8080 code.

SIM80 also allows the user to call 6800 or 6809 code for applications requiring tight timing or for servicing I/O drivers in real time. This is done by utilizing an unused 8080 opcode.

Interfacing SIM80 is also simple. All that is required of the user is to supply three vectors for console input, output and monitor or operating system entry.

SIM80 is available on EC tape or Percom diskette for \$34.95. It will also be available on Flex 2 diskette on November 1, 1980 for the same price.

'88 Micro Journal
Knox, Tenn. 37345

Dear Mr. Williams:

I am writing this letter to applaud a little known supplier of SS-50 boards. Walter Wimberly, 29th Sunrise Dr., Orlando, Fla. 32803. Walt offers a 16K EPROM and now a 16K RAM card for this bus. Each has complete address decoding and so can be addressed into the upper 32k of memory.

I first purchased the EPROM board from Walt and was pleasantly surprised by its quality and documentation. This board is divided into four 4K byte blocks each independently addressable on any 4K boundary. It takes 2708's, 3K by 8 multi-voltage EPROMS, addressable anywhere in memory that isn't previously occupied. I use it, among other things, for my modified version of SWIBUG at \$2000.

I just found out about and have bought Walt's most recent offering, an SS-50, 16K RAM card which uses 2337's. I am delighted. This card is organized as two 8K blocks each independently addressable to an unused 8K boundary anywhere within a 64K system.

The quality of the design and the board itself are excellent and I, for one, am very pleased with my investment.

This letter is intended to "spread the word." We have another source of SS-50 boards. There's another good guy with good products and I want to point him out.

Sincerely,

 Dan S. Grostick

TRANSFER SWTP 6800 COMPONENTS TO SWTP 69/K

Don Grostick
 21555 Plum Rd.
 Boca Raton, FL 33433

I have been successful in transferring my 6800 based I/O and memory components to the new SWTP 69/K mainframe running FLEX 9 Version 2.6. I want to share my experiences with others considering this move.

OVERVIEW

I had been running FLEX on a SWTP 6800 with 40K of memory & MP-L parallel interface, a MP-S serial interface, a MP-R eprom programmer, and a DC-2 mini-floppy controller.

There are two significant changes that should be noted when transferring any I/O device to the 69/K with the new MP-B3 motherboard. Each port now has 16 addresses as compared to 4 addresses in the 6800 MP-3 and MP-B2 motherboards. This is accomplished by dedicating the UD3 and UD4 as the additional addressing lines (now RS2 & RS3 respectively). Also the +/- 12 volt inputs now supply +/- 16 volts.

MP-L, MP-S, MP-R, DC-2

The MP-L, MP-S and MP-R will plug into the slots without modification. The MP-S does use the 16 volt input but is not affected by the increased voltage. The DC-2 mini-floppy controller is not directly compatible with the new motherboard as it was designed to be decoded on Port 5 & 6 on the 6800 motherboard.

A relatively simple modification requiring one 7400 IC and a few wires can be easily installed to provide the necessary decoding. First two lands must be cut. Position the DC-2 controller bottom side up with the J2 30 pin connector towards you. Cut the leftmost land (UD3) - the CS6 (inout) between J2 and the first feedthru. Next turn the board over and locate the leftmost land on the top side (I/O port select) and follow it to the first feedthru. Turn the board over and cut the I/O select line at the short land located between R12 and D2. Mount the IC (a 7400) piggyback on IC11 (soldering up all legs except pins 7 & 14 which should be soldered to IC11). Connect the new IC as shown in Figure 1.

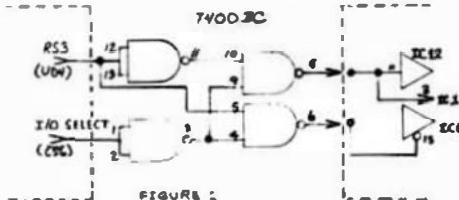

FIGURE 1

DAN GROSTICK 305-342566(W)

BOCA RATON FL 6/27/80	
33433	
SIZE	DRAWING NO.
A	DC-2 MODIFICATIONS
SHEET	OF 3
REV —	
LTR	

Note that the inputs are CS6 (I/O port select) and RS3 (MP-B2 UD4), not the previously used UD3. The outputs from the chip may be connected to the feedthrus inboard from the cut lands. Double check your wiring and plug the modified controller into port 1 as required by FLEX 9. Note that the DC2 board uses zener diodes to regulate inputs from the +/- 16 volt supply and is not affected by the increased voltages from the new power supply.

MEMORY

The SWTP MP-MP 4K memory, MP-BM 8K memory, and the Digital Research 16K static memory cards do not require any special modifications for the 69/K.

69/K GENERAL COMMENTS

SWTP should be complimented on a well designed and implemented package that allows a reasonable level of compatibility with previous products. The most significant shortcoming is a very noisy cooling fan that drowns out any chance of silence. S-BUG has an improved user interface as compared to the previous monitors. FLEX 9 Version 2.6, although lacking any multitask capability, offers an excellent price / performance ratio.

CONCLUSION

Transferring existing components to a new system is a cost effective way to upgrade without losing existing capability. In consideration of the economics, the move to a 6809 system did not cost much more than upgrading with a MP-09 processor card. The sale of the 6800 system plus the cost of a MP-09 was close enough to the cost of the new system to justify the move.

Volset

When your disk library gets as large as mine with nearly a hundred mini-floppies, there is often a need to change the volume names and or serial numbers of disks without having to reinitialize them. VOLSET was written to do just this.

FLEX disks have a System Information Record which contains information concerning disk space for FLEX usage and the volume name and serial number. The volume name and serial are not used by FLEX at all so changing them is quite safe.

There is a FLEX function to open and read the SIR but its method of use is not entirely clear from the documentation so I chose to do single sector I/O directly on the SIR.

The actual makeup of the SIR is in fact best described in the 6809 adaption guide. The offset for the volume name is 16 decimal bytes and the serial number 27 bytes. The volume name is in ASCII but the number is in BINARY. The number therefore has a maximum value of 32767. My system has two drives and I use drive 1 as the work disk all of the time. I fixed the drive for VOLSET to 1 for this reason and also I think that changing the system disk SIR could, under certain situations eg spooling, be dangerous.

The command format is:

VOLSET,(NEWNAME),(NEWNUMBER).

The fields NEWNAME and NEWNUMBER are optional and if either field is invalid then no changes will be made to that field. The actual program is straightforward and the listings are sufficient for the description of operation. The conversion to FLEX09 is just a matter of changing a few addresses and submitting the source to the TSC 6809 assembler which will automatically convert 6800 instructions to 6809 equivalents in flight.

Finally, I recently reassembled the PROT command to allow files to be set to read protect and also displayed as having read protect on. The problem is that even if the read protect bit (bit 5, byte 15 in FCB) is on then FLEX ignores it. I have not discovered the exact mechanism employed by FLEX to check for read protected files, but if

the instruction at location \$B9C3 is replaced by 2 NOP's then the file will be checked for read protect and the appropriate error message reported. The problem with this patch is that once a file is read protected then the PROT

command will not allow the status to be changed as the file is read protected. The PROT command could be made to temporarily alter \$B9C3 to \$2706 to enable read protection to be removed. There are a number of tests and switches in FLEX which appear to be connected with file protection one of these is \$B41A which is tested before the read protect test is made.

```

The attached program, PUL-B22.TXT, may be of interest to some readers who are all thumbs where hardware is concerned.

The program uses the CB2 line of a 8020 PIA to generate some pulses. The length of time the output is high or low is variable and selectable. The main work section is LOOP, it operates by setting bit 3 high and then low (lines 36 & 61). The length of time CB2 is on or off is determined by the HEX values you select during SETUP. As you observe the waveform on a scope you may reset the variables if you enter the ESC key.

HELP - HELP - HELP - HELP

Problem with 008 ASMB.L - Only works if Option B (no creation of binary file) is selected. Error codes generated 0100, 08 and sometimes 0303! Binary file is loaded in directory but with 0000 as beginning and ending track and sector!

Please send me your solution in 100 bytes or less. Thanks.

Dear Sirs:

I am very satisfied with a product advertised in your magazine, and would like to pass my comments on to your readers.

DYNABOPI Systems PASCAL was shipped promptly and set all advertising claims. It is very compact and easily usable on a small system with only a single cassette. The manual is very good, but does assume some basic knowledge of PASCAL. Included is an interesting sample test program that runs well.

The whole PASCAL system resides in memory at once and consists of (from the bottom up) of the P-code interpreter, supervisor, editor and compiler. Free there up is workspace. The editor allows you to write the source into the workspace, which can be saved after returning to the supervisor. The compiler can then be run to convert the source to P-code in the workspace. The supervisor can then start the execution of the user P-code.

A nice feature is the ability of the supervisor to move the user P-code down to the area occupied by the editor and compiler resulting in a much smaller 'run-time' package.

This PASCAL can manipulate 8 bit bytes and 16 bit integers in external memory (seven I/O devices) by use of a POINTERT type. This combined with the ability to call and pass parameters to machine language routines provides a lot of power. I also found that the P-code execution did not seem to mind running with interrupt enabled and handled by machine language routines.

All these features combined with the manual's information for adapting to any hardware configuration make this a handy package for small control applications - even if you already have a disc based PASCAL.

Maybe enough interest in Mr. Jost's software will encourage him to add REAL, about the only thing missing from this PASCAL.

Sincerely,

Eric Pierce C.E.T.

Dear Sirs,

- I have developed some software in BASIC which:
- 1) will print en masse to companies in DATA statements
 - a) for a cover letter
 - b) for an envelope
 - 2) will search for a particular company
 - a) for a cover letter
 - b) for an envelope
 - 3) will provide a complete listing of one's personal belongings entered in DATA statements
 - 4) will search for an item, manufacturer or value greater than that entered

These programs provide hard copy to port 7 using miniFlex BASIC.

While there is nothing unusual about these programs I would like to know if such programs can be copyrighted as I was thinking of selling them for \$10.00 for a version on floppy. It might save someone hours writing the programs and just involve the keyboard slavery of entering DATA statements.

Does anyone know where to insert jump to routines in Dyna-Soft PASCAL for printer driver routines?

Thank you,
Jeffrey M. Craig

HELP!

Does anyone know of the availability of a program, running under SSB 6809 DOS69, that will read FLEX files and convert them to SSB DOS format? Has someone figured out how to make the SSB TEXT PROCESSOR provide vertical page centering for letters?

STAR-KITS

6800 HARDWARE

SBC-02 single board computer uses 6802 with RAM, ROM, I/O, ideal controller, intelligent interface, and more. Printed circuit board is \$25, complete controller kit \$75, wired and tested \$150. Also available: HUMBUG (see below), Basic in ROM, etc.

CT-PS serial/parallel interface card. ACIA-type interface for RS-232C terminal and/or a parallel keyboard. Makes keyboard look like a terminal with absolutely no program patching. Ideal for video board based systems. Bare board \$20, complete kit \$55, wired \$100.

6800 FIRMWARE

HUMBUG monitor. Totally MIKBUG compatible, plus single-stepping, multiple breakpoints, formatted memory dumps, multiple port control and more. "Fantastic!" say our customers. 2K version \$40 on 2708 or 2716 EPROM with source listing. Alternate versions, including video board versions available.

PERCOM DOS PATCH gives more disk space, bigger directory. Best of all, adds error detection/correction to your system so your files are guaranteed right. We correct your 2708s for \$40, or supply three new ones for \$50.

6800 SOFTWARE

BASIC UTILITY PACKAGE renumbers, pretty-prints, prints variable and transfer indexes, compares, shortens Basic programs. On Percom or miniFlex disk for \$30.

CHECK 'N TAX balances your checkbook, finds errors, prepares income tax data. On Percom, miniFlex, Flex 2.0* or Flex 9* disk for \$40.

SORT-MERGE—the only one for Percom disk systems, sorts even full-disk files. \$35.

BASTRAN a Basic preprocessor. Adds long variable names, line labels instead of line numbers, and other conveniences to any standard 6800 disk Basic. On miniFlex* or Flex 2.0* disk for \$30.

6800 CROSS-ASSEMBLER written in Basic. Assemble 6800/6802 programs on your new 6809 (or your 370 at work!). Available on 5" disk, KC cassette, or TRS-80 Level II cassette for \$9.95.

GAME PACK with Eliza and 3-D Tic-Tac-Toe. 5" disk or KC cassette \$15.

Send sase for catalog or more information. *are trademarks of TSC.

COMPUTERWARE means BUSINESS

Our 6800/6809 software is doing the job for:

- University Credit Union
- Computer Manufacturers
- California Bookkeeping Service
- Southern Church Administration
- an Electronics Manufacturing Firm
- Florida Physician and many, many more across the nation

Computerware software is in the business community providing visibility, efficiency, and control to managers for small businesses and commercial users.

Applications Include:

- Payroll
- Mailing System
- Inventory Control
- Accounts Receivable
- Text Processing
- Accounts Payable
- Medical Office
- Ledger Accounting and more!

And... we have the hardware too! Yes, if you're looking for total support for your business' data processing applications, you've found it at:

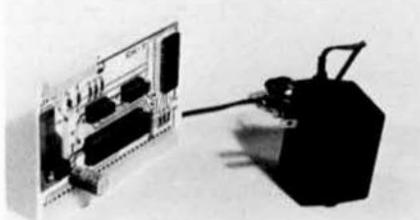

COMPUTERWARE
1512 Encinitas Blvd., Box 668
Encinitas, CA 92024

THE SCREDITOR II AND TREK6864 ARE HERE!!

We've spent the last year working on it. We've taken your ideas and added some of our own, and come up with the most powerful, easy-to-use, EDITOR/FORMATTER available today for the 6800! Look at a few of the features of the SCREDITOR II and see why we say it's the BEST editor available for KEYBOARD-MAPPED DISPLAYS!

- FULL SCREEN FORMATTING — Tabs and margins are fully dynamic — set or move them anywhere, any time! Word wrap, paragraph splitting, line welding will honor the current margin!
- DYNAMIC SCREEN DISPLAY — What you do is immediately visible on the screen — inserts, deletes, line changes, copies, file merges, etc... all happen as you watch!
- MULTI-MODE EDITING — Is LINE mode, no wrap or paragraph filling takes place. Ideal for Basic, Pascal, Fortran or assembly language coding! In TEXT mode, automatic word wrap, paragraph filling, etc... make document preparation a breeze!
- REPLACEMENT STRINGS — Define commands w/o del., phrases, even command sequences as a single character — one keystroke entry replaces a lot of typing! Even save and load the replacement to and from disk!
- KEYBOARD QUEUE BUFFER — For systems which can support interrupt operation, full type-ahead is a standard feature!
- STYLES CUSTOMIZATION — No more hours of machine code patches with the SCREDITOR II — we provide a complete SYSTEM program which will do the work for you — simply answer the questions, and your patches are done!

The SCREDITOR II now supports 30 commands, 24 screen operators, and is completely upward-compatible with all text and source file handling programs! A full co-resident processor to be announced soon! Available now for TEC PLUX 1.0 and 2.0, SED, OS/8000 and SYMPCo mini-PLUX, and all popular KEYBOARD-MAPPED DISPLAYS!

At last a REAL-TIME, LIVE-ACTION TREK-type simulation for the 6800 to bore! TREK6864 is the most exciting arcade-type game ever available for 6800 users!

- AS YOU WATCH, the DARTSTANG invaders implement confusing battle plans, their fleet moving toward you, firing as they come, their photon torpedoes homing on you!
- AS YOU WATCH, your energy depletes, becoming dangerously low and you cannot warp because of damage. But wait!
- AS YOU WATCH, a massive flambos + WARP DRIVES REPAIRED! Now to find a base - you scan - a base is found! You rotate the CENTURIAN to prepare to warp... and a torpedo hits! CLOAKING DEVICE DAMAGED! You warp!
- AS YOU WATCH, the quadrant you entered is infested with more DARTSTANG... and they have spotted you! Even as you move toward your base, you are hit again and again! IMPULSE ENGINES DAMAGED! CLOAKING DEVICE REPAIRED! You cloak quickly to await repairs, as the DARTSTANG begin to sweep the quadrant in confusion! Will your energy run out before the repairs are complete? Will the CENTURIAN destroy your base before you can dock? Only time will tell as you play TREK6864!

This REAL-TIME game is the most engrossing simulation you have ever seen for the 6800! If you have a 64KB KEYBOARD-MAPPED board, and an ACIA or PIA keyboard port, you too can play TREK6864! And, like our SCREDITOR II, we provide a SYSTEM program to make modifications easier! (80 character versions available soon.) And, finally, the price is right!

TREK6864 PROGRAM DISK, MANUAL \$24.95

SMOKE SIGNAL BROADCASTING

Presents

3 Powerful New SS-50/SS-50C Boards

DCB-4

Disk Master

Double Density Controller Board
and DOS68D Double Density DOS

\$449.00

The new DCB-4 is a truly state-of-the-art development which allows up to 366K bytes to be stored on a single 5½" disk and has these outstanding features:

- Up to four 5½" and four 8" drives can be handled in the same system with a user definable logical unit table. (DOS68D will be compatible with future hard disk systems).
- Under software control, the user can select the following for any drive:
 - ★ Single sided or double sided operation.
 - ★ Single density or double density data.
 - ★ 5½" or 8".
 - ★ Stepping Rate.
 - ★ 40 track or 35 track density on double sided 5½" drives.
 - ★ User can select the system boot configuration.
- Occupies only 16 bytes of memory space (F760-F76F standard). User selectable to any 16 byte address space.
- Can read and write a single sector by itself. On-board buffer memory allows full interrupt capability in interrupt driven systems. Once data transfer has been initiated, no more processor time is required.
- Contains extended decoding circuitry for extended addressing per SS-50C bus which can be enabled by an option jumper.
- SS8 provides a means for copying software written by older versions of DOS68 to be read by DOS68D. All new media formatted by DOS68D can be read by all older versions of DOS68. DOS68 is SSB's 6800 disk operating system.
- Track 0 of side 0 is recorded in single density per IBM standard.
- Phase-locked-loop assures highest data integrity attainable.

All of these features are available for immediate delivery on one standard 5½" x 9" 50 pin SS-50/SS-50C card for only \$449.00. The price includes DOS68D version 5.1, MONITOR object code on diskette, and a manual with the source listing.

SCB-69

Super Computer Board

6809CPU Board

\$299.00

The most versatile 6809 CPU Board on the market is now available from Smoke Signal Broadcasting and has the following features:

- Standard 2 MHz operation. (Shipping 1.5 MHz until 6809 available)
- 20 bit address generation for up to 1 Mbyte of memory. Uses an improved address translation RAM which is compatible with present extended addressing schemes yet requires much less overhead when used in multi-user systems.
- All on-board devices can be switch selected to occupy any or all extended pages. Any on-board device may be disabled and its memory space is then available for external memory.
- Standard real-time clock (time-of-day, day-of-week, day-of-month) with battery back up capable of generating programmable interrupts.
- Up to 20K of EPROM can be installed on the CPU Board.
- Standard 1K of RAM on board.
- Includes improved 6809 Monitor (and source listing).
- Contains an FPLA for decoding EPROM address and optional devices. Switches are used to select 2K/4K EPROM and Fast/Slow I/O.
- Contains provision for optional 9511/9512 floating point processor.
- NMI line is user selectable to work with either SS-50 or SS-50C busses.

Price for the new SCB-69 is only \$299.00 for an assembled, burned-in fully tested board.

M-32-X

32K

Memory Board

\$539.00 \$439.00

The first and only 32K Static Ram Board on standard size (5½" x 9") SS-50/SS-50C Bus Circuit Card is made by Smoke Signal.

- Switch selectable to any 4K boundary.
- Any 4K block may be switch enabled or disabled.
- Fully compatible with SS-50C extended addressing (allows memory decoding up to 1 Mbyte).
- Extended addressing capability may be switched off for compatibility with SS-50 systems.
- Gold Bus Connectors for high reliability.
- Guaranteed 2MHz operation (tested at 2.2 MHz).
- Low power consumption — 8 volts at 2.4 amps typical.

M-32-X 32K Memory Board is priced at \$539.00.

M-24-X 24K Memory Board expandable to 32K, is \$439.00.

And our M-16-X 16K board is back to the old price of \$299.00.

Editor - Text Processor - Mailing Labels - Mailing Lists For Any Terminal

Supports Editing commands such as bottom, change, delete, find, insert (single line), input (multiple lines), list, next, overlay (with cursor editing, character deletion and insertion), overstrike (for selected darker text), print, restart, set, top, underline, up, and verify.

Supports Text Processing commands such as block copy, block move, centering, margin justification (widen and narrow), paging, and tabbing.

Mailing Lists and Labels. Use the same mailing list disk file (with protected areas) for both mailing labels and repeat letters. Repeat letters are personally addressed to each person or selected persons on the mailing list.

Most Powerful File Handling found in any editor. Append one file to the end of another, or insert (merge) one file into another as designated by the line pointer. Print specified lines to your printer or to a disk file. Edit files larger than the text buffer. Does not produce output files when not desired. Delete disk files from the Editor.

Printer commands. Control characters can be sent to the printer for format control either directly from the control terminal or by imbedding them in the text. The Set command contains interface initialization and character output routines to support the SWTPC MP-C interface as well as the standard serial and parallel interfaces. User also selects the port address (0 thru 7, A or B) thereby eliminating the need for the user to install printer software routines.

Editor allows exiting to either the monitor or DOS and then reenter (Warm Start) without destroying previously prepared text in the buffer. The Restart command erases contents in the buffer without the user having to reload the editor.

The Editor allows the user to toggle between full duplex (no echo) and half duplex (echo) as needed. It responds to commands in both upper and lower case and can be used to create assembler source code and Basic programs as well as text.

What do you have to lose? Specify 6800 or 6809, SSB or Flex and Version. Source is available for an additional \$35.00

STEREO!
S-100 SOUND COMPUTER BOARD

AI last, an S-100 Board that unleashes the full power of two unbelievable General Instruments AY3-8910 NMOS computer sound IC's. Allows you under total computer control to generate an infinite number of special sound effects for games or any other program. Sounds can be coded in BASIC. ASSEMBLY LANGUAGE, etc.

KIT FEATURES:

- TWO GI SOUND COMPUTER IC'S.
- FOUR PARALLEL I/O PORTS ON BOARD.
- USE ON BOARD AUDIO AMPS OR YOUR STEREO
- ON BOARD PROTO TYPING AREA
- ALL SOCKETS, PARTS AND HARDWARE ARE INCLUDED.
- PC BOARD IS SOLDERMASKED, SILK SCREENED, WITH GOLD CONTACTS
- EASY, QUICK, AND FUN TO BUILD, WITH FULL INSTRUCTIONS
- USES PROGRAMMED I/O FOR MAXIMUM SYSTEM FLEXIBILITY

Both Basic and Assembly Language Programming examples are included

SOFTWARE:

SCL™ is now available! Our Sound Command Language makes writing Sound Effects programs a snap! SCL™ also includes routines for Register Editing, Modify, Memory-Evaluate, Modify, and Play-Memory. SCL™ is available on CPM™ compatible diskette of 2708 or 2716 Diskette. \$24.95 2708 - \$19.95 2716 - \$29.95 Diskette includes the source EPROM's and OROM at E00H.

FACTORY CASE (450 PCS) — \$180
Sockets Special: 22 Pin Low Profile (With Purchase of 5280's) 8 FOR \$1.

NEW! G.I. COMPUTER SOUND CHIP

AY3-8910 As featured in July, 1979 BYTE! A fantastically powerful Sound & Music Generator. Perfect for use with any 8 Bit Microprocessor. Contains 3 Tone Channels, Noise Generator, 3 Channels of Amplitude Control, 16 bit Envelope Period Control, 2-8 Bit Parallel I/O, 3D to A Converters, plus much more! All in one 40 Pin DIP. Super friendly interface to the S-100 or other busses. \$11.95 PRICE CUT!

SPECIAL OFFER: \$14.95 each Add \$3 for 60 page Data Manual.

SOFTWARE FOR THE HARDCORE

We know you hardcore bit hackers will recognize the computing power derived from combining the FORTH language with the 6809, today's most advanced 8 bit microprocessor.

And we know you'll understand this machine's 16 bit math, indirect addressing and two stacks are ideally suited for implementing FORTH.

But...should anyone need further convincing that FORTH provides a new dimension in power, speed and ease of operation, consider the following:

- It's a modern, modular, structured-programming high-level compiled language.
- It's a combined interpreter, compiler, and operating system.
- It permits assembler code level control of machine, runs near speed of assembler code, and uses less memory space than assembler code.
- It increases programmer productivity and reduces memory hardware requirements.

- It replaces subroutines by individual words and related groups of words called Vocabularies. These are quickly modified and tested by editing 1024-character text blocks, called screens, using built-in editor.

tFORTH is a basic system implemented for SS-50 buss 6809 systems with the TSC FLEX 9.0 disk operating system. It is available on 5½" or 8" single density soft-sectorized floppy disks.

\$100.00

tFORTH + consists of tFORTH plus a complement of the following FORTH source code vocabularies: full assembler, cursor controlled screen editor, case statements, extended data types, general I/O drivers.

\$250.00

firmFORTH is an applications package for use with tFORTH. It provides for recompilation of the tFORTH nucleus, deletion of superfluous code and production of fully rommable code.

\$350.00

DS-68 DIGISECTOR

PSB-08 PROM SYSTEM BOARD

B-08 EPROM PROGRAMMER

UIO UNIVERSAL I/O BOARD

INNOVATIVE PRODUCTS FOR 6800 USERS

DS-68 DIGISECTOR is a random access video digitizer featuring 256 x 256 picture element scan and 64 levels of grey scale, with conversion times as low as 3 microseconds per pixel. It accepts either interlaced (NTSC) or non-interlaced (industrial) video input. Use it for computer portraiture, moving target indicators, precision security systems, fast to slow scan conversion...with clever software, the Digi-sector can read just about anything. Truly a professional tool at a price you can afford. \$169.95

DM-85 DISK MIXER is an add-on board for the Smoke Signal Broadcasting BFD-68A Disk Controller which allows operation of both 8" and 5" drives. Controller mode (8" or 5") is selected on a drive-by-drive basis, so any mix of 5" and 8" drives is allowable. The 2" x 3" PC board mounts inconspicuously on the back of the BFD-68A. Its operation is completely transparent to software. An oscilloscope is required for the setup procedure. Kit Price: \$39.95

B-08 2708 EPROM PROGRAMMER is a compact unit that fits in the 6800's I/O slot. A safety switch and LED indicator provide control over the high programming voltage generated on board. An industrial quality Textoo socket and extended board height allow effortless PROM insertion and retrieval. Fully commented source listings of U2708 is included in the Owner's Manual. \$99.95

U2708 utility for testing, burning, verifying and copying 2708s in EPROM. \$29.95

M6809 EMULATOR is a machine language program that will emulate all of the functions of the Motorola 6809 third generation microprocessor. Developed for use on any 6800 system, the program allows software development and debugging. The 3K byte program is complete with a 6809 mini-monitor and single-step trace routines. Fully commented source listing included. Specify Smoke Signal Broadcasting or FLEX™ disk, or KCS cassette. \$49.95

PSB-08 PROM SYSTEM BOARD features 1K of high speed, low-power RAM and space for up to 8 2708 EPROMs, both DIP-switch addressable to start on any 8K boundary in memory. The exclusive I/O select feature allows you to move I/O locations up to any unused 1K block in the EPROM memory space. This permits memory expansion to a full 56K of contiguous user RAM. \$119.95

UIO UNIVERSAL I/O BOARD helps you with your custom interfaces. It has space for a 40-pin wire wrap socket into which you may plug any of Motorola's 40 or 24-pin interface chips. All data and control lines are connected to the appropriate edge connector pins. All other bus connections are brought out to a 16-pin socket pad. +5 volt regulator and all Molex connectors are provided; regulated +5 and ground are bused among the locations for up to 35 14-pin ICs. \$24.95

6800/6809 PASCAL

DYNASOFT PASCAL is a cassette based PASCAL subset designed to run on most 6800/6809 systems with 12K or more of memory.

DYNASOFT PASCAL includes most of the control structures of standard PASCAL including IF-THEN-ELSE, CASE-OF-OTHERWISE, WHILE-DO, REPEAT-UNTIL, FOR-TO/DOWNTO-DO, and recursive PROCEDURE's and FUNCTION's. It supports the data types INTEGER, CHAR, BOOLEAN, scalar (user-defined), subrange, pointer and ARRAY. It is built around a one pass compiler which produces fast, compact p-code and comes complete with a line-oriented text editor, p-code interpreter, and program SAVE and LOAD routines. The whole system resides in less than 8K.

The cassette version with manual is priced at \$35 plus \$3 for postage and handling. Please specify 6800 or 6809.

MICRO UTILITY PACKAGES

(Flex and 6809 versions soon!)

MICRO PROCEDURES™ — NEW

Turn your SSC 6800 Assembler into a Macro Assembler for more consistent code generation with less programming errors to debug. Use macro libraries for your standard subroutines. Specify 5" or 8". Special limited introductory offers:

MICRO PROCEDURES \$39.00

MICRO PROCEDURES & SSB SA-1 Assembler \$65.00

MICRO WRITER™ — a report utility enabling users to catalog report formats and specs. Turns your printer into a sophisticated printing facility keeping track and performing headings, footings, and accumulations according to your specifications. Includes translator, run time, and over 60 pages of documentation. **\$249.00**

MICRO SORTER™ — a tag sort and reformatting utility that allows cataloging sort formats and specs., written in 6800 assembler for better performance. Enhance sorting Random data files using multi-level, multi-field, ascending/descending sort operations and reformatting information into a new file for later use. **\$129.00**

COMMUNICATIONS, SCREEN FORMATTING and DATA ENTRY UTILITIES UNDER DEVELOPMENT.

RE-MAT-IT™ — for a painless, one-step reformatting utility for SSB DOS 5.1 that will allow you to upgrade disks formatted under 5.1 (or earlier DOS versions) to be compatible with the newer double density disk controller board. **\$24.95**

RE-MAT-IT™ plus SSB DCB-4 DOUBLE DENSITY BOARD \$459.95

POWER PATCH F-1™ — Convert your 6800 Chief-tain to run FLEX® on SSB's or SWTPC's 6809 board.

Power Patch F-1™ for SSB	\$34.95
w/SSB SCB-69 6809 board	\$319.95
Power Patch F-1™ for SWTPC	\$54.95

RECORD MANAGEMENT SYSTEM

RMS

DATABASE MANAGEMENT

- USER DEFINED DATA DICTIONARY AND RECORD FORMAT
- SCREEN ORIENTED, FORM FILL OUT TYPE OF ACCESS
- OPTIONAL TWO LEVEL RECORD HIERARCHY
- ALL FILES IN ASCII TEXT FORMAT, BASIC COMPATIBLE
- DIRECT ACCESS BY KEY FIELD, MULTIPLE INDEX FILES
- EXTENSIVE DOCUMENTATION, SAMPLE APPLICATION INCLUDED
- VERSATILE, PROFESSIONAL QUALITY REPORT WRITER
- BUILT-IN SORT/MERGE •EASY TO USE

RMS is a complete DATABASE MANAGEMENT system for the 6809 computer. It runs under Flex, and supports the CT-82, or other CRT terminal. RMS is a set of five machine language programs that make up the most powerful business programming tool available for the 6809. It can be used by the relative novice, to implement an incredible variety of information storage and retrieval applications, without any programming. However, the programmer can use RMS as part of the solution to a larger problem, saving many hours of unnecessary program development time. RMS can be used to handle data input, editing, validation, on-line retrieval, sorting and printed reports. Custom data manipulation can be filled in by the user's BASIC programs.

DATA BASE MANAGEMENT SYSTEM

The Universal Data Research Data Base Management System provides the user and programmer, with a highly structured and efficient method of programming and data file handling.

The System consists of a Menu of programs to Create, Build, Sort and Maintain Data Files, Generate Reports and Build User Programs. All programs are written in TSC Extended Basic.

Included are Source Programs which contain all the common subroutines necessary for reliable, efficient programming for most applications.

UDRI also has a complete line of Data Base compatible end user programs such as:

- Order Entry/Accounts Receivable/Journal
- Purchase Order/Accounts Payable/History file
- Inventory Control/Bill of material
- Payroll
- Cash Disbursement/Cash Receipts
- Customer and Vendor Programs

Brings it all Together!

Hardware Features

- 2 MHz. 68000 MPU
- Double Floppy Disk Drive - 368K bytes formatted
- 32K, 48K, or 64K byte dynamic RAM
- Intelligent Video Terminal
- Commercial type writer keyboard with function keys and numeric pads
- 2 RS-232C serial ports

Software Features

- UCSD Pascal™ System Software Package
- 68000 Multi-tasking System (MTS6800)
- Business BASIC Compiler
- WORDMATE™ Word Processor
- Various Application Packages

™ UCSD Pascal is a trademark of the Regents of the University of California.

Packaging

- Attractive, Compact, desktop closure
- Light-weight, highly portable
- Provision for 3 I/O Expansion modules
- Highly reliable, ease of maintenance

HEMENWAY ASSOCIATES SOFTWARE SOURCE BOOKS™

Your 6800 is up and running with HEMENWAY ASSOCIATES' complete software system. Software Source Books provide a powerful yet extensible programming package for business, scientific, or personal uses.

Combining detailed descriptions with COMPLETE SOURCE CODE LISTINGS, these books explain the internal operations and algorithms used in HEMENWAY ASSOCIATES' popular systems software.

Imagine getting a complete 6800 software library, and at these surprisingly low prices.

Remember, these are not just books; they are Software Source Books™ complete software resources! Order them today; VISA and MASTERCHARGE accepted.

CP/68 OPERATING SYSTEM

The most powerful operating system available for the 6800 family of microprocessors, this disk-based system features great flexibility. The user can add commands for special purposes. A single transient Peripheral Interchange Program (PIP) transfers data between devices. The system is relocatable anywhere in memory and fits in less than 8K. Other features include device-independent I/O and dynamic file allocation.

U.S. \$34.95
Int. \$52.45

XA6809 MACRO LINKING CROSS-ASSEMBLER

This new two-pass program generates relocatable and linkable code (requires LINK68). Resident on any 6800 system, XA6809 lets you produce code for a 6809 right now. This assembler has full macro facilities and features a COMMON section for the production of ROMable code, Conditional Assembly and fast execution.

U.S. \$24.95
Int. \$31.50

LINK68 LINKING LOADER

This is a one-pass linking loader which allows separately translated relocatable object modules to be loaded and linked together to form a single executable load module, and to relocate modules in memory. It produces a load map and a load module in Motorola MIKBUG loader format. This book provides everything necessary for learning about this system and the nature of linking loader design in general.

U.S. \$7.95
Int. \$11.95

RA6800ML RELOCATABLE MACRO ASSEMBLER

This two-pass assembler produces a program listing, a sorted symbol table listing, and relocatable object code. The object code is loaded and linked with other assembled modules using LINK68. This book fully describes the 6800 assembly language and all major routines used, and includes flow charts, details on interfacing the assembler, Cross-referenced, showing all calling and called-by routines, pointers, flags and temporary variables.

U.S. \$24.95
Int. \$37.45

Structured BASIC language STRUBAL+™COMPILER

The compiler features variable precision from 4 to 14 digits for business or scientific uses and Structured Programming forms. It produces Relocatable and linkable code. You can create data structures with mixed data types, COMMON and DUMMY sections. STRUBAL+™ includes a complete scientific package. It allows for string-handling and is extensible.

U.S. \$49.95
Int. \$74.95

The TimeMinder

This month we introduce the TM-1 "TimeMinder", a new clock/calender board for S50 systems. A 30 pin I/O card based on the OKI MSM382, it keeps track of seconds, minutes, hours, day of week, day of month, month, year, and even allows for February 29th. Optional on-board battery backup and recharging circuit allows timekeeping to go on even when power is off.

The chip communicates thru an on board PIA. Five extra lines are brought out to a connector for user applications. One line is connected to a piezoelectric buzzer circuit for alarm applications. The board can generate interrupts to the system at 1024hz, 1hz, once per minute, and once per hour.

The board comes with assembly and checkout instructions and software assembly listing. A diskette is available separately for FLEX 2.0(tm)* systems. It contains the demonstration software, several FLEX utilities, and a patch for FLEX 2.0 that causes it to load the data into FLEX and display the date and time instead of prompting for the date. Source files are also included.

TM-1 Bare Board and Documentation \$35.00
TM-FLEX-1 5 1/4 diskette for FLEX 2.0 \$18.00

Add \$2.50 e/h to order. *FLEX is a trademark of TSC.

- POWERFUL INTEGRATED 6800, 6809 SOFTWARE -

All software is supplied in relocatable format and may be loaded anywhere in memory

6800 RELOCATING ASSEMBLER AND LINKING LOADER. The assembler supports relocatable and absolute code, labeled common blocks, 47 error messages, alphabetized or non-alphabetized cross reference table, 8 char global and local labels, TSC source compatibility, and much more. The linking loader will link up any number of object modules and place the resultant object anywhere in memory that you wish.
M68-ASMB-1A-10, M68-LOAD-1A-10 \$100.00

6800 ONE PASS LINK EDITOR. Functions in a similar manner to the linking loader except that the final object is stored back on disc as one object module. This module may then be loaded anywhere in memory by the linking loader (M68-LOAD-1A-10). This allows the creation of library of relocatable 'quick-load' modules.

M68-LNKA-1A-10 \$45.00

6800 TWO PASS LINK EDITOR. Similar to the one pass link editor. Some optimization is performed.

M68-LNKB-1A-10 \$45.00

6800 GLOBAL CROSS REFERENCE GENERATOR. Provides the capability to tell at a glance all object modules that reference a particular internal label.

M68-XREF-1A-10 \$35.00

6800 OBJECT DISPLAYER. Lists the header of an object module. Parameters displayed are program name, internal labels, external labels, time, date, and identification.

M68-DISP-1A-10 \$25.00

SPECIAL OFFER. All 6 M6800 programs above are available for \$200.00

A 6800 users manual describing all 6 programs above is available for \$15.00. This is refundable with your purchase of the assembler and linking loader. All 6800 software is supplied on 5-inch FLEX discs and runs with FLEX 2.0.

6809 RELOCATING ASSEMBLER AND LINKING LOADER. Supports features similar to those of the 6800 software above. Will also assemble 6800 and 6809 instructions.

M69-ASMB-1A-10 \$100.00

The following 4 programs function in a similar manner to their 6800 counterparts.

6809 ONE PASS LINK EDITOR.

M69-LNKA-1A-10 \$45.00

6809 TWO PASS LINK EDITOR.

M69-LNKB-1A-10 \$45.00

6809 GLOBAL CROSS REFERENCE GENERATOR.

M69-XREF-1A-10 \$35.00

6809 OBJECT DISPLAYER.

M69-DISP-1A-10 \$25.00

SPECIAL OFFER. All 6 M6809 programs above are available for \$200.00

A 6809 users manual describing all 6 programs above is available for \$15.00 (refundable with purchase of assembler and loader). All 6809 software is supplied on 5-inch FLEX discs and runs with FLEX 9.0.

A CATALOG of all of our Software Products is available FREE for the asking.

GIMIX PROUDLY PRESENTS!!!

SS50C 6809 CPU

The 6809 CPU card will be available in a standard version and our 8809 PLUS version that is fully socketed to allow adding options at anytime.

- + A 6840 timer package that provides 3 independent 16 bit counters is included on all 6809 PLUS cards.
- + A 9511 or 9512 Arithmetic Processors option with its own independent crystal that allows you to use 2, 3, or 4 MHz parts in any combination with the 6809 running at 1, 1.5, or 2 MHZ.
- + 1K of scratchpad RAM
- + A Time of Day Clock option with battery back-up. With this option you can also substitute 1K of CMOS RAM that will also be battery backed up.
- + User selectable processor speeds without having to change the crystal.

32K of PROM, ROM or RAM. Both versions have 4 sockets that can each hold from 1K to 8K parts. Single or multiple voltage parts can be used on the PLUS version. The standard version only allows the use of single voltage parts.

All on board devices and options can use extended addressing so that they will only respond to that page to which they are set.

The card is double buffered and allows versatility in the use of software and memory address control disciplines.

Please note that this card does not have an on board baud rate generator, and must be used in systems where baud rates (if needed) are provided elsewhere in the system.

NEW MICRO-WINCHESTER DISK DRIVE FOR MICROCOMPUTERS

CSI announces a new option for their UDS 470 microcomputer: the micro-winchester hard disk drive. Available 4Q 1980 the micro-winchester drive will replace one of the two mini-floppy drives now standard with the UDS 470, thereby bringing a dramatic increase in on-line storage capacity.

This increased storage — 6.38 Megabytes — makes the UDS 470 viable for business applications requiring more on-line storage than previously available with floppy disk drives.

The micro-winchester drive will fit directly into the existing UDS 470 cabinet. Thus customers will realize the benefit of increased storage capacity without the disadvantage of finding space for a larger cabinet or an additional disk drive enclosure.

6809 PROCESSING POWER!

only \$199.95

The Percom SBC/9™: A "10" By Any Measure.

Available with either the new, powerful 6809 µP or an optional 6800-software-compatible 6802, here are 10 beautiful reasons why the Percom SBC/9™ is not just another runner-up MPU/Single-Board-Computer card.

- ① SS-50 bus direct, plug-in-compatible upgrade MPU. Requires no modification of the system bus, I/O or memory.
- ② Full-capability stand-alone single-board computer. Accommodates a 6809 microprocessor or optional 6802 microprocessor without modification.
- ③ On-card 1 K ROM monitor "auto-links" to optional second 1 K PROM — if installed. Second PROM may be used to easily extend or modify the primary monitor command set.
- ④ Eight-bitparallel port is multi-add ess extension of system bus. Accommodates an exceptional variety of peripheral devices ranging from game paddles and keyboards to memory management modules. Connector is optional.
- ⑤ Serial port includes a full-range selectable bit rate generator. Optional subminiature 'D' connector provides RS-232 compatibility.
- ⑥ Extendable addressing via SS-50 bus baud lines to 1 Mbyte. Extendable addressing to 16 Mbytes or more through the parallel "super port."
- ⑦ Includes 1 Kbyte of static RAM.
- ⑧ All on-card I/O is fully decoded so that adjacent memory space may be used.
- ⑨ ROM circuit may be jumper-wired for single- or triple-voltage 2716 EPROM.
- ⑩ On-card power regulators simplify power supply design by minimizing regulation demands.

Plug the SBC/9™ into your SS-50 system bus, and just that easily you've upgraded to the new super-fast super-powerful 6809 MPU with such programming amenities as 10 addressing modes, 16-bit instructions, auto-increment/auto-decrement and position-independent code. Plus, you now have extended addressing capability, and operation under control of PSYMON™, the most powerful and flexible 1K ROM 6809 operating system yet written.

Products are available at Percom dealers nationwide. Call toll-free, 1-800-527-1582, for the address of your nearest dealer, or to order direct. Prices and specifications subject to change without notice.

TM trademark of Percom Data Company, Inc.

Percom SYstem MONitor PSYMON™ provides the usual ROMmonitor functions in 1 Kbyte. It is easily extended and customized because its unique "look-ahead" program structure first searches an alternate command table. The table, if present, may be used to redefine or extend PSYMON's™ command set.

And with PSYMON™, I/O is easily directed to any peripheral device — even a disk system — through a Device Control Block table located

in memory. This allows you to leave the details of I/O software to the separate I/O device drivers.

A PSYMON™ ROM is included free with the purchase of an SBC/9™. The Users Manual includes a source listing.

The 1 Kbyte ROM monitor for the SBC/9™ 6802 option includes a primary set of typical 6800-compatible monitor commands. As for PSYMON™, the commands are easily extended or modified.
